Abstract
In the current article we propose a new efficient, reliable and breakdown-free algorithm for solving general opposite-bordered tridiagonal linear systems. An explicit formula for computing the determinant of an opposite-bordered tridiagonal matrix is investigated. Some illustrative examples are given.

Keywords
Opposite-Bordered Tridiagonal Matrix, Algorithm, Linear System of Equations, Schur Complement, MATLAB

1. Introduction
The \( n \times n \) general tridiagonal matrix \( T_n \) takes the form:

\[
T_n = \begin{bmatrix}
  d_1 & a_1 & 0 & \cdots & 0 \\
  b_1 & d_2 & a_2 & \ddots & \vdots \\
  \vdots & \ddots & \ddots & \ddots & \vdots \\
  b_{n-2} & 0 & \cdots & b_{n-1} & d_{n-1} \\
  0 & \cdots & 0 & b_{n-1} & d_n
\end{bmatrix}
\] (1)

The matrix in (1) frequently appears in many applications, for example, in parallel computing, telecommunication system analysis, solving differential equations using finite differences, heat conduction and fluid flow...
problems. The interested reader may refer to [1]-[12] and the references therein.

Inverting tridiagonal matrices in (1) have been considered by many authors. See for instance, [13]-[22]. To study matrices of the form (1) it is advantageous to introduce an $n$-dimensional vector $e$ in the following way [23]:

$$e = [e_1, e_2, \cdots, e_n]. \quad (2)$$

whose components $e_1, e_2, \cdots, e_n$ are given by:

$$e_i = \begin{cases} d_i, & \text{if } i = 1, \\ d_i - a_{i-1}b_{i-1}e_{i-1}, & \text{if } i = 2, 3, \cdots, n. \end{cases} \quad (3)$$

The symbolic algorithm DETGTRI [23] is based on (2) and (3). By using the LU factorization of $T_n$, it is known that [23]

$$\det(T_n) = \prod_{r=1}^{n} e_r. \quad (4)$$

There are great interests in solving general opposite-bordered tridiagonal linear system, and hereafter it will be referred to as OBTLS, of the form:

$$Ax = f, \quad (5)$$
in which the coefficient matrix $A$ is given by:

$$A = \begin{bmatrix} d_0 & a_0 & 0 & \cdots & \cdots & 0 & p_0 \\ b_0 & d_1 & a_1 & \ddots & & \vdots & p_1 \\ q_1 & b_1 & d_2 & a_2 & \ddots & \vdots & p_2 \\ & \vdots & \ddots & \ddots & \ddots & \vdots & \vdots \\ q_{n-3} & \cdots & b_{n-4} & d_{n-3} & a_{n-3} & p_{n-3} \\ q_{n-2} & \cdots & \cdots & b_{n-3} & d_{n-2} & a_{n-2} \\ & 0 & \cdots & \cdots & 0 & b_{n-2} & d_{n-1} \end{bmatrix}. \quad (6)$$

$x = [x_1, x_2, \cdots, x_n]$ and $f = [f_0, f_1, \cdots, f_{n-1}]$.

This system frequently occurs in engineering computation and science, e.g. in the numerical solution of an ablation and heat transfer problem as referred in [24]-[28]. The matrix $A$ in (6) can be stored in $5n-6$ memory locations only.

In [28], the author presented a numeric algorithm for solving the linear system (5) with $p_0 = q_{n-2} = 0$. The algorithm is based on the elementary column operations (ECO’s). It is noted that the numerical algorithm in [28] fails to solve some OBTLS of the form (5). Therefore, the main objective of the present paper is to construct a new symbolic and breakdown-free algorithm for solving the OBTLS in (5).

Throughout this paper, the word “simplify” means simplifying the algebraic expression under consideration to its simplest rational form. Also, $\lambda$ is a formal parameter which can be treated as a symbolic name whose actual value is 0 as we will see later.

The organization of the paper is as follows. The main results are given in the next section. Some illustrative examples are given in Section 3. In Section 4, we present some concluding remarks.

### 2. Main Results

In this section, we are going to formulate a new algorithm for solving OBTLS of the form (5). We begin by considering the singly bordered tridiagonal linear systems of the form (7)-(8) below.

#### 2.1. A Symbolic Algorithm for Solving Singly Bordered Tridiagonal Linear Systems

The $k \times k$ singly bordered tridiagonal linear system takes the form:
\[ S_k y = \tilde{f}. \]  

where

\[
S_k = \begin{bmatrix}
d_1 & a_1 & 0 & \ldots & \ldots & 0 & p_1 \\
b_1 & d_2 & a_2 & \ddots & \vdots & \vdots & p_2 \\
0 & b_2 & d_3 & a_3 & \ddots & \vdots & 0 \\
\vdots & \ddots & \ddots & \ddots & \ddots & \vdots & \vdots \\
\vdots & \ddots & \ddots & \ddots & \ddots & \ddots & 0 \\
0 & \ldots & \ldots & \ldots & b_{k-3} & d_{k-2} & a_{k-2} & p_{k-2} \\
0 & \ldots & \ldots & \ldots & b_{k-2} & d_{k-1} & a_{k-1} & \gamma_{k-1} \\
0 & \ldots & \ldots & \ldots & 0 & b_{k-1} & d_k & \gamma_k \\
\end{bmatrix},
\]  

\[ y = [y_1, y_2, \ldots, y_k]^T \quad \text{and} \quad \tilde{f} = [f_1, f_2, \ldots, f_k]^T. \]

The Doolittle LU factorization of \( S_k \) is given by [1]:

\[
S_k = LU
\]  

where

\[
L = \begin{bmatrix}
1 & 0 & \ldots & \ldots & 0 \\
\gamma_1 & 1 & \ddots & \vdots & \vdots \\
\vdots & \ddots & \ddots & \ddots & \vdots \\
\vdots & \ddots & \ddots & \ddots & \ddots \\
\gamma_{k-2} & 1 & 0 \\
0 & \ldots & \ldots & 0 & \gamma_{k-1} \\
0 & \ldots & \ldots & 0 & 1 \\
\end{bmatrix},
\]  

\[
U = \begin{bmatrix}
c_1 & a_1 & 0 & \ldots & \ldots & 0 & \beta_1 \\
c_2 & a_2 & \ddots & \vdots & \vdots & \vdots & \beta_2 \\
\vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\
\vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \ddots \\
\gamma_{k-1} & a_{k-1} & a_k & \beta_{k-1} & \beta_k \\
\gamma_{k-2} & a_{k-2} & a_{k-1} & \beta_{k-2} & \beta_{k-1} \\
\gamma_{k-3} & a_{k-3} & a_{k-2} & \beta_{k-3} & \beta_{k-2} \\
\gamma_1 & a_1 & a_2 & \beta_1 & \beta_2 \\
0 & \ldots & \ldots & 0 & \beta_1 \\
0 & \ldots & \ldots & 0 & \beta_2 \\
0 & \ldots & \ldots & 0 & \beta_3 \\
0 & \ldots & \ldots & 0 & \beta_4 \\
0 & \ldots & \ldots & 0 & \beta_5 \\
0 & \ldots & \ldots & 0 & \beta_6 \\
0 & \ldots & \ldots & 0 & \beta_7 \\
0 & \ldots & \ldots & 0 & \beta_8 \\
\end{bmatrix}.
\]  

where the quantities \( c_i, i=1,2,\ldots,k \), \( \gamma_i \) and \( \beta_i, i=1,2,\ldots,k-1 \) are given, respectively, by:

\[
c_i = \begin{cases} 
  d_i, & \text{for } i = 1, \\
  d_i - \gamma_{i-1} a_{i-1}, & \text{for } i = 2, 3, \ldots, k-1, \\
  d_i - \gamma_{k-1} a_{k-1}, & \text{for } i = k, 
\end{cases}
\]  

\[
\gamma_i = \frac{b_i}{c_i}, \quad \text{for } i = 1, 2, \ldots, k-1
\]  

and

\[
\beta_i = \begin{cases} 
  p_1, & \text{for } i = 1, \\
  p_i - \gamma_{i-1} \beta_{i-1}, & \text{for } i = 2, 3, \ldots, k-2, \\
  a_{k-1} - \gamma_{k-2} \beta_{k-2}, & \text{for } i = k-1. 
\end{cases}
\]  

It follows from (9)-(11) that

\[
\det(S_k) = \prod_{i=1}^{k} c_i.
\]
At this point, it should be mentioned that the above \( LU \) factorization is always possible even if the matrix \( S_k \) is singular.

The solution of the system in (7) reduces to solving the two standard linear systems:

\[
Lz = \tilde{f},
\]

and

\[
Uy = z.
\]

We are now ready to formulate the following algorithm for solving the linear system (7).

**Algorithm 1: A Symbolic Algorithm for Solving Singly Bordered Tri-diagonal Linear System.**

To solve the linear system of the form (7), we may proceed as follows:

**Input:** Order of the matrix \( n \) and the components, \( a_i, d_i, b_i, p_i, f_i \).

**Output:** The solution vector \( y = [y_1, y_2, \ldots, y_k]^T \).

**Step 1:** Set \( z_1 = f_1, c_1 = d_1, \gamma_1 = \frac{b_1}{c_1} \)

If \( c_1 = 0 \) then \( c_1 = \lambda \) end

**Step 2:**

for \( i = 2, 3, \ldots, k - 1 \) do

Compute and simplify:

\( c_i = d_i - a_{i-1} \gamma_{i-1} \).

If \( c_i = 0 \) then \( c_i = \lambda \) end

\( z_i = f_i - \gamma_{i-1} z_{i-1} \).

\( \gamma_i = \frac{b_i}{c_i} \).

end

**Step 3:**

for \( i = 2, 3, \ldots, k - 2 \) do

Compute and simplify:

\( \beta_i = p_i - \beta_{i-1} \gamma_{i-1} \).

end

\( \beta_{k-1} = a_{k-1} - \beta_{k-2} \gamma_{k-2} \).

\( z_k = f_k - \beta_{k-1} \gamma_{k-1} \).

\( c_k = d_k - \beta_{k-1} \gamma_{k-1} \).

If \( c_k = 0 \) then \( c_k = \lambda \) end

**Step 4:**

\( y_k = \frac{c_k}{z_k - \beta_{k-1} y_{k-1}} \)

\( y_{k-1} = \frac{c_{k-1}}{z_{k-1} - \beta_{k-2} y_{k-2}} \)

for \( i = k - 2, k - 3, \ldots, 1 \) do

Compute and simplify:

\( y_i = (z_i - a_i y_{i+1} - \beta_i y_k)/c_i \).

end

**Step 5:** Substitute \( \lambda = 0 \) in all expressions of the solution vector \( y_i, i = 1, 2, \ldots, k \).

### 2.2. A Symbolic Algorithm for Solving General OBTLs

In order to solve the general OBTLs (5) it is convenient to introduce the following notations:

\[
g' = [a_0, 0, \ldots, p_0] \in \mathbb{R}^{k(n-1)},
\]

\[
g = \begin{bmatrix} b_0, q_1, q_2, \ldots, q_{n-3}, q_{n-2} \end{bmatrix} \in \mathbb{R}^{(n-1) \times 1},
\]

\[
S_{n-1} = \begin{bmatrix}
  d_1 & a_1 & 0 & \cdots & 0 & p_1 \\
  b_1 & d_2 & a_2 & \ddots & \vdots & \vdots \\
  \vdots & \ddots & \ddots & \ddots & \ddots & \vdots \\
  0 & \cdots & \cdots & b_{n-4} & d_{n-3} & a_{n-3} \\
  \vdots & \ddots & \ddots & \ddots & \ddots & \ddots \\
  0 & \cdots & \cdots & 0 & b_{n-2} & d_{n-1} \\
\end{bmatrix},
\]

\[
x = x_1, \quad \tilde{x} = [x_2, x_3, \ldots, x_n]^T,
\]
Based on the above notations, the linear system in (5) can be written in the partitioned form:

\[
A \begin{bmatrix} \dot{x} \\ \dot{x} \end{bmatrix} = \begin{bmatrix} d_0 & g' \\ q & S_{a-1} \end{bmatrix} \begin{bmatrix} \dot{x} \\ \dot{x} \end{bmatrix} = \begin{bmatrix} f \\ \tilde{f} \end{bmatrix}.
\] (21)

The solution of the linear system (21), may be obtained by solving the two linear systems:

\[
d_0 \dot{x} + g' \dot{x} = f,
\] (22)

\[
q \dot{x} + S_{a-1} \dot{x} = \tilde{f},
\] (23)

It is not difficult to prove that:

\[
\dot{x} = S_{a-1}^{-1} \tilde{f} - S_{a-1}^{-1} q \dot{x}.
\] (24)

As can be seen from (24), we need to compute \( v = S_{a-1}^{-1} \tilde{f} \) and \( w = S_{a-1}^{-1} q \). By solving the following singly bordered systems with two right-hand sides we obtain the solution vectors \( v \) and \( w \):

\[
S_{a-1} \begin{bmatrix} v \\ w \end{bmatrix} = \begin{bmatrix} \tilde{f} \\ q \end{bmatrix}.
\] (25)

Consequently, we have from (24)

\[
x_a = v_1 - x_1 w_{a-1},
\] (26)

and

\[
x_a = v_{a-1} - x_1 w_{a-1}.
\] (27)

By substituting (26) and (27) into (22), it follows that

\[
x_i = \frac{f_0 - d_0 v_1 - p_0 v_{a-1}}{d_0 - a_0 w_1 - p_0 w_{a-1}}.
\] (28)

Therefore, we get

\[
\dot{x} = v - x_1 \cdot w.
\] (29)

Hence, the solution vector of the OBTLs (5) is \( \dot{x} = \begin{bmatrix} \dot{x} \\ \dot{x} \end{bmatrix} \).

The proofs of the following result may be found in [29].

**Theorem 1.** (Schur determinant identity) Let \( M_1, M_2, M_3 \) and \( M_4 \) are \( m \times m \), \( m \times (n-m) \), \( (n-m) \times m \) and \( (n-m) \times (n-m) \) matrices, respectively. Let \( M \) be a \( 2 \times 2 \) block matrix given by

\[
M = \begin{bmatrix} M_1 & M_2 \\ M_3 & M_4 \end{bmatrix}.
\] (30)

Then

\[
\det(M) = \begin{cases} 
\det(M_1) \det(M_4 - M_3 M_1^{-1} M_2) & \text{if } M_1 \text{ is nonsingular,} \\
\det(M_4) \det(M_1 - M_2 M_4^{-1} M_3) & \text{if } M_4 \text{ is nonsingular.}
\end{cases}
\]

By noticing (21), we see that the matrix \( A \) in (6) can be written in the partitioned form:

\[
A = \begin{bmatrix} d_0 & g' \\ q & S_{a-1} \end{bmatrix}.
\] (31)

Hence, by applying Theorem 1 on this matrix, we get the following result:

**Corollary 1.** Let \( A \) be the \( n \times n \) matrix given in (31), then the determinant of \( A \) is given by:
\[ \text{det}(A) = \left( \prod_{i=1}^{n} c_i \right) \left( d_n - a_n w_i - p_n w_{n-1} \right) \bigg|_{i=0}, \] (32)

provided \( S_{n-1} \) is a nonsingular matrix.

The main result of the present paper may now be formulated as follows:

**Algorithm 2:** A symbolic algorithm for solving general nonsingular opposite-bordered tridiagonal linear system.

To solve the linear system of the form (7), we may proceed as follows:

- **Input:** Order of the matrix \( n \) and \( a_i, d_i, b_i, p_i, q_i, f_i \).
- **Output:** The solution vector \( x = [x_1, x_2, \ldots, x_n]^t \).
- **Step 1:** Solve the linear systems in \( S_{n-1} v \| w = [\tilde{f} \| q] \) by using Algorithm 1.
- **Step 2:** Compute \( x_1 \) by using (29).
- **Step 3:** Compute \( \tilde{x} = v - x_1 w \).
- **Step 4:** The solution vector is \( x = [\tilde{x}, \tilde{x}]^t \) when \( \lambda = 0 \).

This algorithm will be referred to as the **OBS** algorithm. The computational cost for **OBS** is \( 21n - 35 \) in terms of total number of flops, where each flop represents one of the four basic arithmetic floating point operations.

A MATLAB code based on the **OBS** algorithm is available upon request from the authors.

**3. Illustrative Examples**

In this section we are going to consider some illustrative examples. The symbolic computations are performed in Example 1 by using MATLAB with Symbolic Math Toolbox. Also, we compare the proposed algorithm with MATLAB back-slash and the algorithm in [28] by means of execution times and accuracy of the solutions in Example 2. Finally, we give Example 3 in order to demonstrate the validity of the **OBS** algorithm. All experiments were carried out using MATLAB 7.10.0.499 (R2010a) on a PC with Intel(R) Core(TM) i7-3770 CPU processor.

**Example 1.** Solve the opposite-bordered tridiagonal linear system:

\[
\begin{bmatrix}
1 & 2 & 0 & 0 & 0 & 0 & 0 & 0 \\
1 & 2 & 5 & 0 & 0 & 0 & 0 & 7 \\
-2 & 2 & 5 & 3 & 0 & 0 & 0 & -1 \\
1 & 0 & 2 & 1 & -1 & 0 & 0 & 2 \\
5 & 0 & 0 & 1 & 6 & 2 & 0 & -3 \\
3 & 0 & 0 & 0 & 1 & 1 & 3 & 4 \\
2 & 0 & 0 & 0 & 0 & 1 & 3 & 2 \\
0 & 0 & 0 & 0 & 0 & 0 & 2 & 4 \\
\end{bmatrix}
\begin{bmatrix}
x_1 \\
x_2 \\
x_3 \\
x_4 \\
x_5 \\
x_6 \\
x_7 \\
x_8 \\
\end{bmatrix}
= \begin{bmatrix}
3 \\
15 \\
7 \\
5 \\
11 \\
12 \\
8 \\
6 \\
\end{bmatrix}
\] (33)

**Solution.**

Here, \( n = 8 \), \( d_0 = 1 \), \( \tilde{f} = 3 \), \( \tilde{f} = [15, 7, 5, 1, 2, 12, 8, 6] \), \( g = [2, 0, 0, 0, 0, 0, 0] \), \( q = [1, -2, 1, 5, 3, 2, 0] \), and

\[
S_{n+1} = \begin{bmatrix}
2 & 5 & 0 & 0 & 0 & 0 & 7 \\
2 & 5 & 3 & 0 & 0 & 0 & -1 \\
0 & 2 & 1 & -1 & 0 & 0 & 2 \\
0 & 0 & 1 & 6 & 2 & 0 & -3 \\
0 & 0 & 0 & 1 & 1 & 3 & 4 \\
0 & 0 & 0 & 0 & 1 & 3 & 2 \\
0 & 0 & 0 & 0 & 0 & 2 & 4 \\
\end{bmatrix}
\]

The numeric algorithm in [28] fails to solve the linear system (33) although \( \text{det} A = 148 \neq 0 \). Applying the
\[ \begin{align*}
\mathbf{v} &= \begin{bmatrix} 5 & 5\lambda - 23 & 15 & 19\lambda - 64 & 4(-1 + \lambda) & 3(23\lambda - 58) & \cdots & -22 + 7\lambda & 10(2\lambda - 5) \\
211\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
211\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
\end{bmatrix}.
\end{align*} \]

\[ \begin{align*}
\mathbf{w} &= \begin{bmatrix} -163 + 38\lambda & 41 & -219 + 3\lambda & -22 + 3\lambda & 2(25\lambda - 74) & -2(-24 + 7\lambda) & 2(-24 + 7\lambda) \\
211\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
211\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
211\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
211\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
211\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & 11\lambda - 26 & \cdots & 11\lambda - 26 & 11\lambda - 26 \\
\end{bmatrix} \quad (\text{Step 1}).
\end{align*} \]

\[ \begin{align*}
\hat{x} &= \lambda = \frac{37 + 8\lambda}{49\lambda + 37} \quad (\text{Step 2}) \quad \text{and} \quad \hat{x} = \lambda = \frac{139\lambda + 74}{2(49\lambda + 37)} \frac{37}{49\lambda + 37} \frac{37 + 89\lambda}{49\lambda + 37} \frac{37 + 20\lambda}{49\lambda + 37} \frac{37 + 27\lambda 1}{49\lambda + 37} \frac{37 - 21\lambda}{49\lambda + 37} \frac{37 + 84\lambda}{49\lambda + 37} \quad (\text{Step 3}).
\end{align*} \]

The solution vector \( \mathbf{x} = [\hat{x}, \hat{x}] \) = \([1, 1, 1, 1, 1, 1, 1, 1, 1] \) \( (\text{Step 4}). \)

**Example 2.** Consider the opposite-bordered tridiagonal linear system:
\[
\begin{pmatrix}
4 & 1.2 & 0 & \cdots & \cdots & 0 & 0 \\
2.3 & 4 & 1.2 & \ddots & \vdots & \vdots & \vdots \\
2.5 & 2.3 & 4 & 1.2 & \ddots & \vdots & \vdots \\
2.5 & 0 & \ddots & \ddots & \ddots & \vdots & \vdots \\
\vdots & \vdots & \ddots & \ddots & \ddots & \vdots & \vdots \\
2.5 & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\
0 & \cdots & \cdots & 0 & 2.3 & 4
\end{pmatrix}
\begin{pmatrix}
x_1 \\
x_2 \\
x_3 \\
x_{n-2} \\
x_{n-1} \\
x_n
\end{pmatrix}
= \begin{pmatrix}
5.2 \\
9 \\
11.5 \\
11.5 \\
10 \\
6.3
\end{pmatrix}.
\]

The exact solution of this system is \( \mathbf{x}^* = \left[ 1, 1, \ldots, 1 \right] \). **Table 1** shows the CPU times (after 100 tests) obtained from the OBS algorithm, the algorithm in [28] and MATLAB back-slash operator for \( n = 1000, 2000, \ldots, 10,000 \). The absolute errors \( \|\mathbf{x} - \mathbf{x}^*\| \) are shown in Figure 1. Here, \( \| \cdot \| \) is the Euclidean vector norm.

**Example 3.** Consider the opposite-bordered tridiagonal linear system:
\[
\begin{pmatrix}
4 & 2 & 0 & \cdots & 0 & 1 \\
1 & 4 & 2 & \ddots & \vdots & \vdots \\
2 & 1 & 4 & 2 & \ddots & \vdots \\
2 & 0 & \ddots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \ddots & \ddots & \ddots & \vdots \\
2 & \ddots & \ddots & \ddots & \ddots & 1 \\
0 & \cdots & \cdots & 0 & 1 & 4
\end{pmatrix}
\begin{pmatrix}
x_1 \\
x_2 \\

4. Conclusion

In this paper, we proposed a new efficient and reliable algorithm for solving general opposite-bordered tridiagonal linear systems in linear time. An explicit formula for computing the determinant of an opposite-bordered tridiagonal matrix is obtained. Some illustrative examples are given.
