ABSTRACT

In this work, we investigate one class of Volterra type integral equation, in model case, when kernels have first order fixed singularity and logarithmic singularity. In detail study the case, when $n = 3$. In depend of the signs parameters solution to this integral equation can contain three arbitrary constants, two arbitrary constants, one constant and may have unique solution. In the case when general solution of integral equation contains arbitrary constants, we stand and investigate different boundary value problems, when conditions are given in singular point. Besides for considered integral equation, the solution found cane represented in generalized power series. Some results obtained in the general model case.

Keywords: Neoclassical Volterra Type Integral Equation; Left Boundary Singular Point; Boundary Value Problems

1. Introduction

Let $\Gamma = \{x: a < x < b\}$ be a set of point on the real axis and consider an integral equation

$$\varphi(x) + \int_{a}^{x} \left[ \sum_{k=0}^{n} p_k \ln^{k-1} \left| \frac{x-a}{t-a} \right| \varphi(t) \right] \frac{dt}{t-a} = f(x),$$

(1)

where $p_i (1 \leq j \leq n)$ is given constants, $f(x)$ is given function in $\Gamma$ and $\varphi(x)$ to be found.

In what follows we in detail go into case $n = 3$. In this case the Equation (1) accepts the following form

$$\varphi(x) + \int_{a}^{x} \left[ p_1 + p_2 \ln \left( \frac{x-a}{t-a} \right) + p_3 \ln^2 \left( \frac{x-a}{t-a} \right) \right] \varphi(t) \frac{dt}{t-a} = f(x).$$

(1)

Integral Equation (1) at $p_3 = 0, p_1 = 0$ is model second kind Volterra type singular integral equation with left boundary singular point, theory construction in [1-5]. In the case, when in (1) $p_1 = 0$ Equation (1) investigates in [6].

As [4,5] the solution to this equation is sought in the class of function $\varphi(x) \in C[a,b]$, $\varphi(a)=0$ with following asymptotic behavior

$$\varphi(x) = o \left[ (x-a)^E \right], \; E > 0 \; \text{at} \; x \to a.$$
\[ D_0^p \phi(x) + p_1 D_0^p \phi(x) + p_2 D_0 \phi(x) p_3 \phi(x) = D_0^p f(x), \]  
where \( D_0 = (x-a) \frac{d}{dx} \).

Homogeneous differential Equation (3) is corresponding to the following characteristic equation
\[ \lambda^3 + p_1 \lambda^2 p_2 \lambda + 2 p_3 = 0. \]  
(4)

2. Representation the General Solution

2.1. The Case, When the Roots of the Characteristic Equation Real and Different

Let in differential Equation (3) parameters \( p_j (1 \leq j \leq 3) \) such that, the roots of the characteristic Equation (4) real and different. Its denote by \( \lambda_1, \lambda_2, \lambda_3 \). In this case, immediately testing we see that, general solution homogeneous differential Equation (2) is given by formula
\[ \phi(x) = (x-a)^{\lambda_1} C_1 + (x-a)^{\lambda_2} C_2 + (x-a)^{\lambda_3} C_3, \]  
(5)

where \( C_j (1 \leq j \leq 3) \) arbitrary constants.

When, \( \lambda_j > 0 (1 \leq j \leq 3) \), function \( \phi(x) \) definable by formula (5) satisfy homogeneous integral Equation (1). So, function \( \phi(x) \) determined by formula (5) is given general solution homogeneous integral Equation (1).

For obtained the solution non homogeneous integral Equation (1), first time use the variation arbitrary constants methods, we use the general solution of the differential Equation (3). After transformation, we see that, if solution integral Equation (1) in this case exist, then we its my be represented in the following form
\[ \phi(x) = K_1 [C_1, C_2, C_3, f(x)] \]

(6)

where \( C_j (1 \leq j \leq 3) \) arbitrary constants,
\[ \Delta_0 = \begin{bmatrix} 1, 1, 1 \\ \lambda_1, \lambda_2, \lambda_3 \\ \lambda_1^2, \lambda_2^2, \lambda_3^2 \end{bmatrix} \]

The solution of the type (6) obtained in the case, when \( f(x) \in C^3 (\Gamma) \), \( f(a) = 0 \), solution integral equation (1), function \( \phi(x) \) exist and belong to Class \( C^3 (\Gamma) \).

Immediately testing, we see that, of \( \lambda_j > 0 (1 \leq j \leq 3) \), \( f(x) \in C^3 (\Gamma) \), \( f(a) = 0 \) with asymptotic behavior
\[ f(x) = o(\sqrt[\delta_1]{x-a}), \delta_1 > \lambda, \]

then function (5) satisfied Equation (1).

Theorem 1. Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \) such that, the roots of the algebraic Equation (4) real, different and positive, function \( f(x) \in C(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior (7). Then integral Equation (1) in class of function \( \phi(x) \in C(\Gamma) \)

vanishing in point \( x = a \) is always solvability and its solution is given by formula (6), \( C_j (1 \leq j \leq 3) \) are arbitrary constants.

Characteristics 1. Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \) such that, the roots of the characteristic Equation (4) real, different and \( \lambda_1 < 0, \lambda_2 > 0, \lambda_3 > 0 \), then it follows, from formula (6) \( C_i = 0 \).

In this case, if exist the solution integral Equation (1), then it is possible is represent in following form
\[ \phi(x) = K_2 [C_1, C_2, f(x)] \]

(8)

where \( C_1, C_2 \) are arbitrary constants.

The solution of the type (8) exist, if \( f(x) \in C(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior
\[ f(x) = o(\sqrt[\delta_2]{x-a}), \delta_2 > \mu_i, \]

(9)

\( \mu_i = \min(\lambda_1, \lambda_2, \lambda_3) \) at \( x \rightarrow a \) .

Be valid the following confirmation.

Copyright © 2013 SciRes. AM
So, in this case have the following confirmation.

**Theorem 2.** Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \) such that, the roots of the algebraic Equation (4) real, different and also \( \lambda_1 < 0 \), \( \lambda_2 > 0 \), \( \lambda_3 > 0 \), \( f(x) \in C(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior (9). Then integral Equation (1) in class of function \( \phi(x) \in C(\Gamma) \) vanishing in point \( x=a \) is always solvability and its solution is given by formula (8), \( C_j (j = 4, 5) \) are arbitrary constants.

**Characteristics 2.** Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \) function \( f(x) \) satisfy any condition of theorem 2. Then, from (8) it follows, the solution integral Equation (1) \( \phi(x) \in C(\Gamma) \), \( \phi(a) = 0 \) with following asymptotic behavior

\[
\phi(x) = o \left( (x-a)^\nu \right) \]

\[
= K_2 \left[ C_0, f(x) \right],
\]

where \( C_0 \) are arbitrary constant.

The solution of the type (10) exist, if \( f(x) \in C(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior

\[
f(x) = o \left( (x-a)^\nu \right), \quad \delta_3 > \lambda_3 \quad at \quad x \to a. \quad (11)
\]

So, we proof.

The following confirmation.

**Theorem 3.** Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \) such that, the roots of the algebraic Equation (4) real, different and also \( \lambda_1 < 0 \), \( \lambda_2 < 0 \), \( \lambda_3 > 0 \), \( f(x) \in C(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior (11). Then integral Equation (1) in class of function \( \phi(x) \in C(\Gamma) \) vanishing in point \( x=a \) is always solvability and its solution is given by formula (10), where \( C_j \) are arbitrary constant.

**Characteristics 3.** Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \), function \( f(x) \) satisfy any condition of theorem 2. Then the solution of the integral Equation (1) in point \( x=a \) vanish and its asymptotic behavior determined from formula

\[
\phi(x) = o \left( (x-a)^\nu \right) at \ x \to a.
\]

**Remark 1.** Confirmation similar to theorem 2 obtained and in the following cases:

a) \( \lambda_1 > 0 \), \( \lambda_2 < 0 \), \( \lambda_3 < 0 \); b) \( \lambda_1 > 0 \), \( \lambda_2 > 0 \), \( \lambda_3 < 0 \).

If the roots of the characteristic equation (4) real and different, \( \lambda_1 < 0 \), \( \lambda_2 > 0 \), \( \lambda_3 < 0 \), then from integral representation (6), follows, that in order that \( \phi(x) \) is solution integral Equation (1) in this case, it is necessary \( C_j = C_2 = 0 \). In this case, if exist solution integral Equation (1), then it will be represented in following form

\[
\phi(x) = f(x) + \frac{1}{\Delta_0} \left[ \lambda_1 \left( \frac{t-a}{x-a} \right)^{\nu_1} + \lambda_2 \left( \frac{t-a}{x-a} \right)^{\nu_2} + \lambda_3 \left( \frac{t-a}{x-a} \right)^{\nu_3} \right] f(t) dt = K_3 \left[ f(x) \right]
\]

\[
(12)
\]

The solution of the type (12) exist, if \( f(x) \in C(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior

\[
f(x) = o \left( (x-a)^\nu \right), \quad \varepsilon > 0 \quad at \quad x \to a \quad (13)
\]

So we proof the following confirmation.

**Theorem 4.** Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \) such that, the roots of the algebraic Equation (4) real, different and positive. The function \( f(x) \in C(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior (13). Then integral Equation (1) in class of function \( \phi(x) \in C(\Gamma) \) vanishing in point \( x=a \) have unique solution, which give by formula (12).

**Characteristics 4.** Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \), function \( f(x) \) satisfy any condition of theorem 4. Then the solution of the integral Equation (1) in point \( x=a \) vanish and its asymptotic behavior determined from formula

\[
\phi(x) = o \left( (x-a)^\nu \right), \quad \varepsilon > 0 \quad at \quad x \to a.
\]

**2.2. The Case, When the Roots of the Characteristic Equation Real and Equal**

Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \), such that, the roots of the characteristic Equation (4) real and equal.

In this case we have the following confirmation:
**Theorem 5.** Let in integral Equation (1) parameters $p_j$ ($1 \leq j \leq 3$) such that, the roots of the characteristic Equation (4) real, equal and positive, that is $\lambda_1 = \lambda_2 = \lambda > 0$. Assume that a function $f(x) \in C(\Gamma)$, $f(a) = 0$ with the following asymptotic behavior

$$f(x) = \alpha [ (x-a)^{\beta} ]^{\delta}, \text{at } x \to a.$$  

Then homogeneous integral Equation (1) in class of function $\varphi(x) \in C(\Gamma)$ vanishing in point $x = a$, have three linear independent solutions the type

$$\varphi_1(x) = (x-a)^{\delta}, \quad \varphi_2(x) = (x-a)^{\delta} \ln(x-a),$$

$$\varphi_3(x) = (x-a)^{\delta} \ln^2(x-a).$$

Non homogeneous integral Equation (1), always solvable. Its general solution contain three arbitrary constant and given by formula

$$\varphi(x) = \alpha [ (x-a)^{\beta} ]^{\delta},$$

$$\varepsilon > 0, \text{at } x \to a.$$  

From integral representation (14) follows. If solution integral Equation (1) at $\lambda_1 = \lambda_2 = \lambda_3 = \lambda < 0$ exist, then we may be represented it’s in form

$$\varphi(x) = f(x) + x \ln(x-a)$$

The solution of the type (15) exist, if $f(x) \in C(\Gamma)$, $f(a) = 0$ with the following asymptotic behavior

$$f(x) = \alpha [ (x-a)^{\beta} ]^{\delta}, \varepsilon > 0, \text{at } x \to a.$$  

So in the case, when $\lambda_1 = \lambda_2 = \lambda_3 = \lambda < 0$, proof the following confirmation.

**Theorem 6.** Let in integral Equation (1) parameters $p_j$ ($1 \leq j \leq 3$) such that, the all roots of the characteristic Equation (4) real, equal and negative, that is $\lambda_1 = \lambda_2 = \lambda_3 = \lambda < 0$. Assume that a function $f(x) \in C(\Gamma)$, $f(a) = 0$ with the asymptotic behavior (16). Then, integral Equation (1) in class $C(\Gamma)$ have unique solution and give by formula (15).

**Characteristics 5.** In this case, when fulfillment any condition theorem 5, then solution integral equation in point $x = a$ vanish and its asymptotic behavior determined from formula

$$\varphi(x) = \alpha [ (x-a)^{\beta} ]^{\delta}, \varepsilon > 0, \text{at } x \to a.$$  

2.3. The Case, When One Roots of the Characteristic Equation Real and Two the Roots of the Characteristic Equation Complex and Conjugate

Let in integral Equation (1) parameters $p_j$ ($1 \leq j \leq 3$) such that, the one roots of characteristic Equation (4) real and two the roots of the characteristic equation complex conjugate. Correspondingly its denote by $\lambda_1$, $\lambda_2 = A + iB$, $\lambda_3 = A - iB$. When $\lambda_1 > 0, A > 0$, then by this roots corresponding following particular solution homogeneous integral Equation (1):

$$\varphi_1(x) = (x-a)^{\beta},$$

$$\varphi_2(x) = (x-a)^{\beta} \cos [B \ln(x-a)]$$

$$\varphi_1(x) = (x-a)^{\beta} \sin [B \ln(x-a)].$$

In this case, if solution integral Equation (1) exist, then it will be represented in form

$$\varphi(x) = (x-a)^{\beta} C_1 + (x-a)^{\beta} \left[ C_2 \cos [B \ln(x-a)] + C_3 \sin [B \ln(x-a)] \right] + f(x)$$

$$\frac{-1}{A_0} \int_{x-a}^{x-a} \left[ \lambda_1 B \frac{x-a}{t-a} + \frac{x-a}{t-a} D_1 \sin [B \ln(x-a)] + D_2 \cos [B \ln(x-a)] \right] f(t) \, dt$$

$$= K \left[ C_1, C_2, C_3, f(x) \right].$$
where
\[ \Delta_0 = 2AB\lambda - \lambda^2 B - B\left(A^2 + B^2\right) \neq 0, \]
\[ D_1 = B^2 - A^2 - A\lambda \left(3B^2 - A^2\right), \]
\[ D_2 = 2AB\left(A^2 + B^2\right) + B\lambda\left(B^2 - 3A^2\right). \]

The solution of the type (18) exist, if \( \lambda > 0, A > 0, \)
\[ f(x) \in C(\bar{\Gamma}), \quad f(a) = 0 \]
with the following asymptotic behavior
\[ f(x) = o\left[(x-a)^{\delta_1}\right], \quad \delta_1 > \max\left(\lambda_1, A\right) \text{ at } x \to a. \quad (19) \]

So in this case we have the following confirmation.

**Theorem 7.** Let in integral Equation (1) parameters
\[ p_j, (1 \leq j \leq 3) \]
such that, one the roots of the characteristic Equation (4) real positive, two out of its complex conjugate \((\lambda_1 = A + iB, \quad \lambda_2 = A - iB)\). Besides let
\[ A = \text{Real}\lambda > 0. \]

\[ \phi(x) = (x-a)^{\delta_2}\left[C_2 \cos\left(B\ln(x-a)\right) + C_3 \sin\left(B\ln(x-a)\right)\right] + f(x) \]
\[ - \frac{1}{\Delta_0} \int_{a}^{\infty} \left[A_1 B \left(\frac{x-a}{t-a}\right)^{\delta_1}\right] \left[D_1 \sin\left(B\ln\left(\frac{x-a}{t-a}\right)\right) + D_2 \cos\left(B\ln\left(\frac{x-a}{t-a}\right)\right)\right], \]
\[ = K_{\bar{n}}\left[C_2, C_3, f(x)\right]. \quad (20) \]

In this case for convergence integrals in right part (20), necessary
\[ f(x) \in C(\bar{\Gamma}), \quad f(a) = 0 \]
with asymptotic behavior
\[ f(x) = o\left[(x-a)^{\delta_2}\right], \quad \delta_2 > A \text{ at } x \to a. \quad (21) \]

So, we proof. the following confirmation.

**Theorem 8.** Let in integral Equation (1) parameters
\[ p_j, (1 \leq j \leq 3) \]
satisfy condition theorem 7, besides \( \lambda_1 > 0, A > 0. \) Let \( \lambda_1 < 0, A > 0. \) Function \( f(x) \in C(\bar{\Gamma}), \)
\[ f(a) = 0 \]
with asymptotic behavior (21). Then homogeneous integral Equation (1), in class \( C(\bar{\Gamma}) \)
vanishing in point \( x = a, \) has two linear Independent solution
\[ \phi_1(x) = (x-a)^{\delta_1}\cos\left(B\ln(x-a)\right), \]
\[ \phi_2(x) = (x-a)^{\delta_1}\sin\left(B\ln(x-a)\right). \]

\[ \phi(x) = (x-a)^{\delta_2}C_1 + f(x) - \frac{1}{\Delta_0} \int_{a}^{\infty} \left[A_1 B \left(\frac{x-a}{t-a}\right)^{\delta_1}\right] \left[D_1 \sin\left(B\ln\left(\frac{x-a}{t-a}\right)\right) + D_2 \cos\left(B\ln\left(\frac{x-a}{t-a}\right)\right)\right], \]
\[ = K_{\bar{n}}\left[C_1, f(x)\right]. \quad (22) \]

Non homogeneous integral Equation (1) always solvable and its general solution from class \( C(\bar{\Gamma}) \) is given by formula (20), where \( C_j (1 \leq j \leq 3) \)-arbitrary constants.

**Characteristics 8.** In the case, when fulfillment any condition theorem 8, then solution integral Equation (1) in point \( x = a \) vanish and its behavior determined from following asymptotic formula
\[ \phi(x) = o\left[(x-a)^{\delta_2}\right], \quad \delta_2 > \lambda_1 \text{ at } x \to a. \]

Now suppose, that the roots of the algebraic Equation (4) satisfy condition of the theorem 7, besides \( \lambda_1 > 0, A > 0. \) Let \( \lambda_2 > 0, A < 0. \) Then, if exist solution integral Equation (1) in this case, then its represented in following form
\[ f(x) = o\left[(x-a)^{\delta_1}\right], \quad \delta_1 > \lambda_2 \text{ at } x \to a. \quad (23) \]

So, we proof. the following confirmation.
Theorem 9. Let in integral Equation (1) parameters \( p_j, (1 \leq j \leq 3) \) satisfy condition theorem 7, besides \( \lambda_j > 0, A > 0 \). Let \( \lambda_j > 0, A < 0 \). Function \( f(x) \in \mathbb{C}(\Gamma) \), \( f(a) = 0 \) with asymptotic behavior (23). Then homogeneous integral Equation (1), in class \( C(\Gamma) \) vanishing in point \( x = a \), one solution \( \varphi(x) = (x-a)^{j_k} \). Non homogeneous integral Equation (1) always solvable and its general solution from class \( C(\Gamma) \) is given by formula (22), where \( C \)-arbitrary constant.

Characteristics 9. In the case, when fulfillment any condition theorem 9, then solution integral Equation (1) in point \( x = a \) vanish and its behavior determined from following asymptotic formula

\[
\varphi(x) = o\left[(x-a)^{j_k}\right],
\]

at \( x \to a \)

In the case, when \( \lambda_j < 0, A < 0 \), then from integral representation (18) follows, that, if exist solution integral Equation (1) in this case, then it is possible in following form

\[
\varphi(x) = a\left[(x-a)^{j_k}\right], \epsilon > 0 \text{ at } x \to a
\]

3. Property of the Solution

Let fulfillment any condition theorem 10, then solution integral equation (1) in point \( x = a \) vanish and its behavior determined from following asymptotic formula

\[
\varphi(x) = o\left[(x-a)^{j_k}\right], \epsilon > 0 \text{ at } x \to a
\]
Differentiating the solution of the type (8), immediate verification, we can easily convince to correctness of the following equality:

\[ D^\alpha \varphi(x) = \lambda_2 (x-a)^{\lambda_2} C_2 + \lambda_3 (x-a)^{\lambda_3} C_3 + D^\alpha f(x) + \frac{\lambda_3^3 + \lambda_2^3 + \lambda_1^3}{\Delta_0} f(x) \]

\[ + \frac{1}{\Delta_0} \int_a^b \left[ \lambda_0 \left( \frac{t-a}{x-a} \right)^{\lambda_0} + \lambda_1 \left( \frac{x-a}{t-a} \right)^{\lambda_1} + \lambda_2 \left( \frac{x-a}{t-a} \right)^{\lambda_2} \right] f(t) \frac{dt}{t-a}. \]

(31)

From equality (8) and (31) we find

\[ C_4 = \frac{-1}{\Delta_0} \lim_{x \to a} \left( (x-a)^{\lambda_2} \left[ D^\alpha \varphi(x) - \lambda_2 \varphi(x) \right] \right) = \frac{-1}{\Delta_0} \lim_{x \to a} T^\alpha \varphi(x), \]

(32)

\[ C_5 = \frac{1}{\Delta_0} \lim_{x \to a} \left( (x-a)^{\lambda_2} \left[ D^\alpha \varphi(x) - \lambda_2 \varphi(x) \right] \right) = \frac{1}{\Delta_0} \lim_{x \to a} T^\alpha \varphi(x). \]

(33)

From integral representation (10) it follows that if parameters \( p_j (1 \leq j \leq 3) \) and function \( f(x) \) in Equation (1) satisfy all condition of theorem 3, then the solution of the type (10) has the property

\[ \left[ (x-a)^{\lambda_2} \varphi(x) \right]_{x=a} = C_6. \]

(34)

From integral representation (14) it follows that

\[ D^\alpha \varphi(x) = (x-a)^{\lambda_2} \left[ \lambda_2 C_2 + (1 + \lambda \ln(x-a)) C_3 \right] (2 \ln(x-a) + \lambda \ln^2(x-a)) C_3 + f(x) \]

\[ + 3 \lambda f(x) + \frac{\lambda_2}{2} \int_a^b \left[ 12 \lambda + 8 \lambda \ln \left( \frac{x-a}{t-a} \right) + \lambda \ln^2 \left( \frac{x-a}{t-a} \right) \right] f(t) \frac{dt}{t-a}. \]

(35)

\[ (D^\alpha \varphi(x) = (x-a)^{\lambda_2} \left[ \lambda_2 C_2 + (2 \lambda + 2 \lambda \ln(x-a) - \lambda^2 \ln^2(x-a)) C_3 \right] + D^\alpha f(x) + 3 \lambda D^\alpha f(x) \]

\[ + \lambda^2 f(x) + \frac{\lambda_2}{2} \int_a^b \left[ 8 \lambda + 12 \lambda^2 + 4 \lambda^2 \ln \left( \frac{x-a}{t-a} \right) + \lambda^2 \ln^2 \left( \frac{x-a}{t-a} \right) \right] f(t) \frac{dt}{t-a}. \]

(36)

Using the formulas (14), (35) and (36), we easily see that, when fulfillment any condition of theorem 5, then solution of the type (14) has the following properties:

\[ C_1 = \lim_{x \to a} \left( (x-a)^{\lambda_2} \left[ \ln^2(x-a) \varphi(x) - 2 \ln(x-a)(1 + \ln(x-a))(D^\alpha \varphi) \right] \right) \]

\[ \cdot D^\alpha \varphi(x)) + (2 + 2 \lambda \ln(x-a) - \lambda^2 \ln^2(x-a)) \varphi(x) = \lim_{x \to a} T^\alpha \varphi(x) \]

(37)

\[ C_2 = -\lim_{x \to a} \left( (x-a)^{\lambda_2} \left[ 2 \ln(x-a)(D^\alpha \varphi(x)) - (2 + 2 \lambda \ln(x-a)) \right] \right) \]

\[ \cdot (2 \lambda - 1) + \ln^2(x-a) (\lambda - \lambda) D^\alpha \varphi(x) + (2 \lambda + 2 \lambda^2 \ln(x-a)) \varphi(x) = \lim_{x \to a} T^\alpha \varphi(x) \]

(38)

\[ C_3 = \lim_{x \to a} \left( (x-a)^{\lambda_2} \left[ (D^\alpha \varphi(x)) - 2 \lambda D^\alpha \varphi(x) + \lambda^2 \varphi(x) \right] \right) = \lim_{x \to a} T^\alpha \varphi(x). \]

(39)

From integral representation (18) it follows that

\[ D^\alpha \varphi(x) = \lambda_2 (x-a)^{\lambda_2} C_2 + (x-a)^{\lambda_2} f(x) \]

\[ \left[ \left(C_2 (A \cos[B \ln(x-a)] - B \sin[B \ln(x-a)]) + C_1 (A \sin[B \ln(x-a)] + B \cos[B \ln(x-a)]) \right) - \frac{\lambda_3^3 + \lambda_2^3}{\Delta_0} f(x) + D^\alpha f(x) \right] \]

\[ + \frac{1}{\Delta_0} \int_a^b \left( \lambda_3 t B \left( \frac{x-a}{t-a} \right)^{\lambda_3} + (x-a)^{\lambda_3} \left[ (AD_1 - D_2 B) \sin \left[ B \ln \left( \frac{x-a}{t-a} \right) \right] + (AD_2 + D_1 B) \cos \left[ B \ln \left( \frac{x-a}{t-a} \right) \right] \right] \right) f(t) \frac{dt}{t-a}. \]

(40)
\[
(D_{t}^{x})^{2} \varphi(x) = \lambda_{x}^{2}(x-a)^{4} C_{1} + (x-a)^{4} \left[ C_{2} \left( A^{2} - B^{2} \right) \cos \left( B \ln(x-a) \right) - 2AB \sin \left( B \ln(x-a) \right) \right] \\
+ C_{3} \left[ \left( A^{2} - B^{2} \right) + 2AB \sin \left( B \ln(x-a) \right) + B \cos \left( B \ln(x-a) \right) \right] \\
- \frac{\lambda_{x}^{2} + AD_{t} + BD_{t}}{\Delta_{0}} f(x) - \frac{1}{\Delta_{0}} \int_{a}^{x} \lambda_{x}^{2} B \left( \frac{x-a}{t-a} \right)^{4} \left( D_{t}^{x} \varphi \right)(x) + \lambda_{x}^{2} B \left( \frac{x-a}{t-a} \right)^{4} \left[ \left( A^{2} - B^{2} \right) D_{t} + 2AD_{t} \right] \cos \left( B \ln \left( \frac{x-a}{t-a} \right) \right) \int_{t}^{x} \frac{f(t)}{t-a} dt.
\]

Using the formulas (18), (40) and (41), we easily see that, when fulfillment any condition of theorem 7, then solution of the type (18) has the following properties:

\[
C_{1} = \frac{1}{\Delta_{0}} \lim_{x \to a} \left[ (x-a)^{4} \left( \lambda_{x}^{2} B \left( D_{t}^{x} \right)^{2} \varphi(x) - 2ABD_{t} \varphi(x) + B \left( A^{2} + B^{2} \right) \varphi(x) \right) \right] = \frac{1}{\Delta_{0}} \lim_{x \to a} T^{x}_{i} \varphi(x), \tag{42}
\]

\[
C_{2} = \frac{1}{\Delta_{0}} \lim_{x \to a} \left[ (x-a)^{4} \left[ \left( D_{t}^{x} \right)^{2} \varphi(x) \left( \lambda_{t} - A \right) \sin \left( B \ln(x-a) \right) - B \cos \left( B \ln(x-a) \right) \right] \right] \\
+ D_{t}^{x} \varphi(x) \left[ \left( A^{2} - B^{2} \right) \sin \left( B \ln(x-a) \right) + 2AB \cos \left( B \ln(x-a) \right) \right] + \varphi(x).
\]

\[
\left[ \lambda_{x}^{2} A - \lambda_{x} \left( A^{2} - B^{2} \right) \right] \sin \left( B \ln(x-a) \right) + \left[ \lambda_{x}^{2} B - 2AB \right] \cos \left( B \ln(x-a) \right) = \frac{1}{\Delta_{0}} \lim_{x \to a} T^{x}_{i} \varphi(x), \tag{43}
\]

\[
C_{3} = \frac{1}{\Delta_{0}} \lim_{x \to a} \left[ (x-a)^{4} \left[ \left( D_{t}^{x} \right)^{2} \varphi(x) \left( A - \lambda_{t} \right) \cos \left( B \ln(x-a) \right) - B \sin \left( B \ln(x-a) \right) \right] \\
- \lambda_{x}^{2} B - \lambda_{x} \left( A^{2} - B^{2} \right) \cos \left( B \ln(x-a) \right) + 2AB \sin \left( B \ln(x-a) \right) \right] \varphi(x).
\]

\[
\left[ \lambda_{x}^{2} A - \lambda_{x} \left( A^{2} - B^{2} \right) \right] \cos \left( B \ln(x-a) \right) - \left[ \lambda_{x}^{2} B - 2AB \right] \cos \left( B \ln(x-a) \right) = \frac{1}{\Delta_{0}} \lim_{x \to a} T^{x}_{i} \varphi(x). \tag{44}
\]

Differentiating the solution of the type (20), immediate verification, we can easily convince to correctness of the following equality:

\[
D_{t}^{x} \varphi(x) = (x-a)^{4} \left[ C_{2} \left( A \cos \left( B \ln(x-a) \right) \right) - B \sin \left( B \ln(x-a) \right) \right] \\
+ C_{3} \left( A \sin \left( B \ln(x-a) \right) + B \cos \left( B \ln(x-a) \right) \right) - \frac{\lambda_{x}^{2} B + D_{t}}{\Delta_{0}} f(x) + D_{t}^{x} \varphi(x) \\
- \frac{1}{\Delta_{0}} \int_{a}^{x} \lambda_{x}^{2} B \left( \frac{x-a}{t-a} \right)^{4} \left( AD_{t} - BD_{t} \right) \sin \left( B \ln \left( \frac{x-a}{t-a} \right) \right) + (AD_{t} + BD_{t}) \cos \left( B \ln \left( \frac{x-a}{t-a} \right) \right) \int_{t}^{x} \frac{f(t)}{t-a} dt.
\]

Using the formulas (20) and (45), we easily see that, when fulfillment any condition of theorem 8, then solution of the type (20) has the following properties:

\[
C_{2} = \frac{1}{\Delta_{0}} \lim_{x \to a} \left[ (x-a)^{4} \left[ A \sin \left( B \ln(x-a) \right) + B \cos \left( B \ln(x-a) \right) \right] \varphi(x) - \sin \left( B \ln(x-a) \right) D_{t}^{x} \varphi(x) \right] \tag{46}
\]

\[
C_{3} = \frac{1}{\Delta_{0}} \lim_{x \to a} \left[ \left[ A \cos \left( B \ln(x-a) \right) \right] + B \sin \left( B \ln(x-a) \right) \varphi(x) + \cos \left( B \ln(x-a) \right) D_{t}^{x} \varphi(x) \right] \tag{47}
\]
From integral representation (22) it follows that if parameters \( p_j \) \((1 \leq j \leq 3)\) and function \( f(x) \) in equation (1) satisfy all condition of theorem 9, then the solution of the type (22) has the property

\[
\left[(x-a)^{-\lambda} \varphi(x)\right]_{x=a} = C_1. \tag{48}
\]

4. Boundary Value Problems

When, the general solution constants, arbitrary constants higher mentioned properties of the solution the integral Equation (1) give possibility for integral Equation (1) put and investigate the following boundary value problems:

**Problem \( N_1 \)**. Is required found the solution of the integral Equation (1) from class \( C(\Gamma) \), when the roots the algebraic Equation (4) real, equal and positive, that is \( \lambda_1 > 0 \), \( \lambda_2 > 0 \), \( \lambda_3 > 0 \), by boundary conditions

\[
\begin{align*}
\left[T_1^* \varphi(x)\right]_{x=a} &= A_1, \\
\left[T_2^* \varphi(x)\right]_{x=a} &= A_2, \\
\left[T_3^* \varphi(x)\right]_{x=a} &= A_3,
\end{align*}
\]

where \( A_1, A_2, A_3 \)-are given constants.

**Problem \( N_2 \)**. Is required found the solution of the integral Equation (1) from class \( C(\Gamma) \), when the roots the algebraic Equation (4) real, different and also \( \lambda_1 > 0 \), \( \lambda_2 > 0 \), \( \lambda_3 > 0 \), by boundary conditions

\[
\begin{align*}
\left[T_1^* \varphi(x)\right]_{x=a} &= A_{11}, \\
\left[T_2^* \varphi(x)\right]_{x=a} &= A_{12}, \\
\left[T_3^* \varphi(x)\right]_{x=a} &= A_{13},
\end{align*}
\]

where \( A_{11}, A_{12}, A_{13} \)-are given constants.

**Problem \( N_3 \)**. Is required found the solution of the integral Equation (1) from class \( C(\Gamma) \), when the roots the algebraic Equation (4) real, different and also \( \lambda_1 < 0 \), \( \lambda_2 < 0 \), \( \lambda_3 > 0 \) by boundary conditions

\[
\begin{align*}
\left[T_1^* \varphi(x)\right]_{x=a} &= A_{21}, \\
\left[T_2^* \varphi(x)\right]_{x=a} &= A_{22}, \\
\left[T_3^* \varphi(x)\right]_{x=a} &= A_{23},
\end{align*}
\]

where \( A_{21}, A_{22}, A_{23} \)-are given constants.

**Problem \( N_4 \)**. Is required found the solution of the integral Equation (1) from class \( C(\Gamma) \), when the roots the algebraic Equation (4) real, equal and positive, that is \( \lambda_1 = \lambda_2 = \lambda_3 = \lambda > 0 \) by boundary conditions

\[
\begin{align*}
\left[T_1^* \varphi(x)\right]_{x=a} &= A_{31}, \\
\left[T_2^* \varphi(x)\right]_{x=a} &= A_{32}, \\
\left[T_3^* \varphi(x)\right]_{x=a} &= A_{33},
\end{align*}
\]

where \( A_{31}, A_{32}, A_{33} \)-are given constants.

**Problem \( N_5 \)**. Is required found the solution of the integral Equation (1) from class \( C(\Gamma) \), when the one roots of the algebraic Equation (4) real positive, two out of its complex-conjugate. Besides \( A = \text{Real} \lambda_2 > 0 \), by boundary conditions

\[
\begin{align*}
\left[T_1^* \varphi(x)\right]_{x=a} &= A_{51}, \\
\left[T_2^* \varphi(x)\right]_{x=a} &= A_{52}, \\
\left[T_3^* \varphi(x)\right]_{x=a} &= A_{53},
\end{align*}
\]

where \( A_{51}, A_{52}, A_{53} \)-are given constants.

**Problem \( N_6 \)**. Is required found the solution of the integral Equation (1) from class \( C(\Gamma) \), when the one roots of the algebraic Equation (4) real positive, two out of its complex-conjugate. Besides \( \lambda_1 < 0 \), \( A = \text{Real} \lambda_2 > 0 \), by boundary conditions

\[
\begin{align*}
\left[T_1^* \varphi(x)\right]_{x=a} &= A_{61}, \\
\left[T_2^* \varphi(x)\right]_{x=a} &= A_{62},
\end{align*}
\]

where \( A_{61}, A_{62} \)-are given constants.

**Solution problem \( N_1 \)**. Let fulfillment any condition of theorem 1. Then using the solution of the type (6) and its properties (28)-(30) and condition (49), we have

\[
C_1 = \frac{\lambda_3 - \lambda_2}{\Delta_0} A_{11}, C_2 = \frac{\lambda_1 - \lambda_3}{\Delta_0} A_{22}, C_3 = \frac{\lambda_2 - \lambda_3}{\Delta_0} A_{33}
\]

Substituting obtained valued \( C_1, C_2 \) and \( C_3 \) in formula (6), we find the solution of problem \( N_1 \) in form

\[
\varphi(x) = K_1 \left[ (\lambda_1 - \lambda_2) A_{11} (\lambda_2 - \lambda_3) A_{12} (\lambda_1 - \lambda_3) A_{13} f(x) \right].
\]

So, we proof.

**Theorem 11.** Let in integral Equation (1) parameters \( p_j (1 \leq j \leq 3) \), function \( f(x) \) satisfy any condition of theorem 1. Then Problem \( N_1 \) has a uniquesolution which is given by formula (56).

**Solution problem \( N_2 \)**. Let fulfillment any condition of theorem 2. Then using the solution of the type (8) and its properties (32), (33) and condition (50), we have:

\[
C_4 = \frac{1}{\Delta_0} A_{21}, C_5 = \frac{1}{\Delta_0} A_{22} .
\]

Substituting this valued \( C_4, C_5 \) in formula (8), we find the solution of problem \( N_2 \) in form
\[ \varphi(x) = K_2 \left[ -\frac{1}{\Delta_0} A_{21}, \frac{1}{\Delta_0} A_{22}, f(x) \right]. \]  

(57)

So, we proof.

**Theorem 12.** Let in integral Equation (1) parameters \( p_j, (1 \leq j \leq 3) \), function \( f(x) \) satisfy condition of theorem 2. Then problem \( N_2 \) has unique solution which is given by formula (57).

**Solution problem \( N_3 \).** Let fulfillment any condition of theorem 3. Then using the solution of the type (10) and its properties (32) and condition (51), we have: \( C_0 = A_{31} \). Substitute this valued \( C_0 \) in formula (10), we find the solution of problem \( N_3 \) in form

\[ \varphi(x) = K_3 \left[ A_{31}, f(x) \right]. \]  

(58)

So, we proof.

**Theorem 13.** Let in integral Equation (1) parameters \( p_j, (1 \leq j \leq 3) \), function \( f(x) \) satisfy condition of Theorem 3. Then problem \( N_3 \) has unique solution, which is given by formula (58).

**Solution problem \( N_4 \).** Let fulfillment any condition of theorem 5. Then using solution of the type (14) and its properties (37)-(39) and condition (52), we have: \( C_1 = A_{41}, C_2 = A_{42}, C_3 = A_{43} \). Substituting this valued \( C_1, C_2 \) and \( C_3 \) in formula (14), we find the solution of problem \( N_4 \) in form

\[ \varphi(x) = K_4 \left[ A_{41}, A_{42}, A_{43}, f(x) \right]. \]  

(59)

So, we proof.

**Theorem 14.** Let in integral Equation (1) parameters \( p_j, (1 \leq j \leq 3) \), function \( f(x) \) satisfy condition of Theorem 5. Then problem \( N_4 \) has unique solution, which is given by formula (59).

**Solution problem \( N_5 \).** Let fulfillment any condition of theorem 7. Then using solution of the type (18) and its properties (42)-(44), and condition (53) we have:

\[ C_1 = \frac{1}{\Delta_0} A_{51}, \quad C_2 = \frac{1}{\Delta_0} A_{52}, \quad C_3 = \frac{1}{\Delta_0} A_{53}. \]  

Substituting this valued \( C_1, C_2 \) and \( C_3 \) in formula (18) we find the solution of problem \( N_5 \) in form

\[ \varphi(x) = K_5 \left[ A_{51}, A_{52}, A_{53}, f(x) \right]. \]  

(60)

So, we proof.

**Theorem 15.** Let in integral Equation (1) parameters \( p_j, (1 \leq j \leq 3) \), function \( f(x) \) satisfy condition theorem 7. Then problem \( N_5 \) have unique solution, which is given by formula (60).

**Solution problem \( N_6 \).** Let fulfillment any condition of theorem 8. Then using solution of the type (20) and its properties (46), (47) and condition (54) we have:

\[ C_2 = \frac{1}{B} A_{61}, \quad C_3 = \frac{1}{B} A_{62}. \]  

Substituting this valued \( C_2 \) and \( C_3 \) in formula (20) we find the solution of problem \( N_6 \) in form

\[ \varphi(x) = K_6 \left[ A_{61}, A_{62}, f(x) \right]. \]  

(61)

So, we proof.

**Theorem 16.** Let in integral Equation (1) parameters \( p_j, (1 \leq j \leq 3) \), function \( f(x) \) satisfy condition theorem 8. Then problem \( N_6 \) have unique solution, which is given by formula (61).

**Solution problem \( N_7 \).** Let fulfillment any condition of theorem 9. Then using solution of the type (22) and its properties (48) and condition (55) we have: \( C_1 = A_{71} \). Substituting this value \( C_1 \) in formula (22) we find the solution of problem \( N_7 \) in form

\[ \varphi(x) = K_7 \left[ A_{71}, f(x) \right]. \]  

(62)

So, we proof.

**Theorem 17.** Let in integral Equation (1) parameters \( p_j, (1 \leq j \leq 3) \), function \( f(x) \) satisfy condition theorem 9. Then problem \( N_7 \) have unique solution, which is given by formula (62).

5. Presentation the Solution of the Integral Equation (1) in the Generalized Power Series

Suppose that \( f(x) \) has uniformly convergent power series expansion on \( \Gamma \):

\[ f(x) = \sum_{k=0}^{\infty} (x-a)^{k+\gamma} f_k, \]  

(63)

where \( \gamma = \text{constant} > 0 \) and \( f_k, k = 0,1,2,\cdots \), are given constants. We attempt to find a solution of (1) in the form

\[ \varphi(x) = \sum_{k=0}^{\infty} (x-a)^{k+\gamma} \varphi_k, \]  

(64)

where the coefficients, \( \varphi_k, (k = 0,1,2,\cdots) \) are unknown. Substituting power series representations of value \( f(x) \) and \( \varphi(x) \) into (1), equating the coefficients of the corresponding function, and for \( \varphi_k \), we obtain

\[ \varphi_k = \frac{(k+\gamma)^3}{(k+\gamma)^3 + p_1 (k+\gamma)^2 + p_2 (k+\gamma) + 2 p_3} f_k, \]  

(65)

\[ k = 0,1,2,3,\cdots. \]

If \( (k+\gamma)^3 + p_1 (k+\gamma)^2 + p_2 (k+\gamma) + 2 p_3 \neq 0 \) for in all \( k = 0,1,2,\cdots \), putting the found coefficients back into (64), we arrive at the particular solution of (1).

\[ \varphi(x) = \sum_{k=0}^{\infty} (x-a)^{k+\gamma} \frac{(k+\gamma)^3}{(k+\gamma)^3 + p_1 (k+\gamma)^2 + p_2 (k+\gamma) + 2 p_3} f_k. \]  

(66)

If, for some values \( k = k_1, \ k = k_2 \) and \( k = k_3 \), con-
stains $\gamma, p_j (1 \leq j \leq 3)$ satisfy
\[(k + \gamma)^3 + p_1 (k + \gamma)^2 + p_2 (k + \gamma) + 2p_3 = 0,\]
then the solution to integral Equation (1) can be represented in the form (64) it is necessary and sufficiently that $f_{j,0} = 0$, $j = 1, 2, 3$, that is, it is necessary and sufficiently that function $f(x)$ in point $x = a$ satisfies the following three solvability condition
\[\left[ (x-a)^{\gamma} f(x) \right]_{x=a}^{(k)} = 0, \quad j = 1, 2, 3. \tag{67}\]
In this case the solution of the integral Equation (1) in the class of function can be represented in form (64) is given by formula
\[
\varphi(x) = \sum_{i=0}^{k_j} (x-a)^{k_j} f_i \left(\frac{(k + \gamma)^3}{(k + \gamma)^3 + p_1 (k + \gamma)^2 + p_2 (k + \gamma) + 2p_3} \right) f_i \\
+ \sum_{i=k_j+1}^{k} (x-a)^{k_j} f_i \left(\frac{(k + \gamma)^3}{(k + \gamma)^3 + p_1 (k + \gamma)^2 + p_2 (k + \gamma) + 2p_3} \right) f_i \\
+ \phi_{k_1} (x-a)^{k_1} + \phi_{k_2} (x-a)^{k_2} + \phi_{k_3} (x-a)^{k_3}
\tag{68}
\]
where $\varphi_{k_1}, \varphi_{k_2}, \varphi_{k_3}$ arbitrary constants.

Immediately testing it we see that, if converges radius of the series (63) is defined by formula $R = \frac{1}{l},$
\[l = \lim_{n \to \infty} \left[ \frac{f_n}{f_{n-1}} \right], \text{ then converges radius of the series (66), (68) are also defined by this formula. So, we prove the next result.}

**Theorem 18.** Let in integral Equation (1), function $f(x)$ represent in form uniformly-converges generalized power series type (63) and
\[(k + \gamma)^3 + p_1 (k + \gamma)^2 + p_2 (k + \gamma) + 2p_3 \neq 0, \tag{69}\]
for $k = 0, 1, 2, \ldots$. Then integral Equation (1) in class of function $\varphi(x)$ represented in form (64) has a unique solution, which is given by formula (66). For values $k = k_j, \quad j = 1, 2, 3,$
\[(k + \gamma)^3 + p_1 (k + \gamma)^2 + p_2 (k + \gamma) + 2p_3 = 0, \tag{70}\]
the existence of the solution of Equation (1) can be represented in form (64) it is necessary and sufficiently fulfillment three solvability condition type (67). In this case integral Equation (1) in class of function represented in form (63) is always solvability and its solution contain tree arbitrary constants and is given by formula (68).

6. **General Case**

In general case to integral Equation (I) corresponding the following algebraic equation
\[
\lambda^n + p_1 \lambda^{n-1} + p_2 \lambda^{n-2} + 2! p_3 \lambda^{n-3} \\
+ 3! p_1 \lambda^{n-4} \ldots + (n-1)! p_{n-1} \lambda = 0. \tag{II}
\]

Some results obtained in the general case to. Example in the case, when the roots of the Equation (II) real, different and positive have the following confirmation.

**Theorem 19.** Let in integral Equation (I) parameters $p_j (1 \leq j \leq n)$ such that, the roots of the algebraic Equation (II) real, different and positive, function $f(x) \in C(\bar{\Omega})$, $f(a) = 0$ with asymptotic behavior
\[
f(x) = o\left[(x-a)^{\delta}\right], \quad \delta > \lambda, \quad \lambda = \max(\lambda_1, \lambda_2, \ldots, \lambda_n) \text{ at } x \to a,
\]
Then integral Equation (I) in class of function $\varphi(x) \in C(\bar{\Omega})$ vanishing in point $x = a$ is always solvability and its solution is given by formula
\[
\varphi(x) = \sum_{i=0}^{k_j} (x-a)^{k_j} C_i \\
+ f(x) \int_\Delta \left[ \sum_{j=1}^{n} \lambda_j \left(\frac{x-a}{t-a}\right)^{\lambda_j} f(t) \right] \frac{dt}{t-a} \tag{III}
\]
where $C_i (1 \leq k \leq n)$ - arbitrary constants,
\[
\Delta_0 = \left| \begin{array}{cccc}
1, & \cdots, & 1, \\
\lambda_1, & \lambda_2, \cdots & \lambda_n, \\
\lambda_1^2, & \lambda_2^2, \cdots & \lambda_n^2, \\
& \cdots \\
& \cdots \\
& \cdots \\
\lambda_1^{n-1}, & \lambda_2^{n-1}, & \cdots, & \lambda_n^{n-1}
\end{array} \right|
\]

7. **Conclusions**

So, in this article we consider new class Volterra type integral equation, which no submitting exists Fredholm theory (Theory Volterra type integral equation in class
the solution general equation
\[
\varphi(x) + \int_a^x \left[ \sum_{n=1}^l K_m(x,t) \ln^{n-1} \left( \frac{x-a}{t-a} \right) \right] \frac{\varphi(t)}{t-a} \, dt = f(x),
\]
reduces to finding solution Volterra type integral equation with weak singularity. On this basis, in depend from roots of the algebraic equation

\[
K_m(a,a) \neq 0 (1 \leq m \leq n), \quad \text{select cases, when general solution equation contains } n, n-1, n-2, \ldots, 1 \text{ arbitrary constants, and cases when Equation (IV) has unique solution.}
\]

In this case, integral Equation (IV), we represented to following form

\[
\varphi(x) + \int_a^x \left[ \sum_{n=1}^l K_m(a,a) \ln^{n-1} \left( \frac{x-a}{t-a} \right) \right] \frac{\varphi(t)}{t-a} \, dt = F(x),
\]
where

\[
F(x) = f(x) - \int_a^x \left[ \sum_{n=1}^{l} (K_m(x,t) - K_m(a,a)) \ln^{n-1} \left( \frac{x-a}{t-a} \right) \right] \frac{\varphi(t)}{t-a} \, dt.
\]

According to the mentioned above, writing the solution integral Equation (VI) in depend to the roots of the characteristic Equation (V) or (II), after substituting for \( F(x) \) from formula (VII) we arrive at the solution of the new type integral equation. At specific condition to functions \( K_m(x,t) - K_m(a,a) \) and \( f(x) \) this integral equation will be Volterra type integral equation with weak singularity in point \( x = a \). In this basis the problem investigation integral Equation (IV), reduce to problem investigation Volterra type integral equation with weak singularity in point \( x = a \).
