Abstract

In this work, the $\exp(-\varphi(\xi))$-expansion method is used for the first time to investigate the exact traveling wave solutions involving parameters of nonlinear evolution equations. When these parameters are taken to be special values, the solitary wave solutions are derived from the exact traveling wave solutions. The validity and reliability of the method are tested by its applications to Nano-ionic solitons wave's propagation along microtubules in living cells and Nano-ionic currents of MTs which play an important role in biology.

Keywords

The $\exp(-\varphi(\xi))$-Expansion Method, Nano-Solitons of Ionic Wave's Propagation along Microtubules in Living Cells, Nano-Ionic Currents of MTs, Traveling Wave Solutions, Kink and Anti-Kink Wave Solutions

1. Introduction

The nonlinear partial differential equations of mathematical physics are major subjects in physical science [1]. Exact solutions for these equations play an important role in many phenomena in physics such as fluid mechanics, hydrodynamics, Optics, Plasma physics and so on. Recently many new approaches for finding these solu-
Tions have been proposed, for example, tanh-sech method [2]-[4], extended tanh-method [5]-[7], sine-cosine method [8]-[10], homogeneous balance method [11] [12], F-expansion method [13]-[15], exp-function method [16] [17], trigonometric function series method [18], \( \frac{G'}{G} \) expansion method [19]-[22], Jacobi elliptic function method [23]-[26], The \( \exp(-\varphi(\xi)) \)-expansion method [27]-[29] and so on.

The objective of this article is to investigate more applications than obtained in [27]-[29] to justify and demonstrate the advantages of the \( \exp(-\varphi(\xi)) \)-method. Here, we apply this method to Nano-solitons of ionic waves’s propagation along microtubules in living cells and Nano-ionic currents of MTs.

2. Description of Method

Consider the following nonlinear evolution equation

\[
f(u, u_t, u_x, u_{tt}, u_{xx}, \cdots) = 0,
\]

where \( F \) is a polynomial in \( u(x, t) \) and its partial derivatives in which the highest order derivatives and nonlinear terms are involved. In the following, we give the main steps of this method.

**Step 1.** We use the wave transformation

\[
u(x, t) = \varphi(\xi) = x - ct,
\]

where \( c \) is a positive constant, to reduce Equation (2.1) to the following ODE:

\[
p(u, u', u'', u''', \cdots) = 0,
\]

where \( P \) is a polynomial in \( u(\xi) \) and its total derivatives.

**Step 2.** Suppose that the solution of ODE (2.3) can be expressed by a polynomial in \( \exp(-\varphi(\xi)) \) as follow

\[
u(\xi) = a_m (\exp(-\varphi(\xi)))^m + \cdots, \quad a_m \neq 0,
\]

where \( \varphi(\xi) \) satisfies the ODE in the form

\[
\varphi'(\xi) = \exp(-\varphi(\xi)) + \mu \exp(\varphi(\xi)) + \lambda,
\]

The solutions of ODE (2.5) are

When \( \lambda^2 - 4\mu > 0, \mu \neq 0 \),

\[
\varphi(\xi) = \ln\left\{-\sqrt{\lambda^2 - 4\mu} \tanh\left(\frac{\sqrt{\lambda^2 - 4\mu}}{2}(\xi + c_1) - \frac{\lambda}{2\mu}\right)\right\}.
\]

When \( \lambda^2 - 4\mu > 0, \mu = 0 \),

\[
\varphi(\xi) = -\ln\left(\frac{\lambda}{\exp(\lambda(\xi + C_1)) - 1}\right).
\]

When \( \lambda^2 - 4\mu = 0, \mu \neq 0, \lambda \neq 0 \),

\[
\varphi(\xi) = \ln\left(-\frac{2(\lambda(\xi + C_1) + 2)}{\lambda^2(\xi + C_1)}\right).
\]

When \( \lambda^2 - 4\mu = 0, \mu \neq 0, \lambda = 0 \),

\[
\varphi(\xi) = \ln(\xi + C_1),
\]

When \( \lambda^2 - 4\mu < 0 \),
\[
\varphi(\xi) = \ln \left( \sqrt{4\mu - \lambda^2} \tan \left( \frac{\sqrt{4\mu - \lambda^2}}{2} \left( \xi + c_1 \right) \right) - \lambda \right),
\]

(2.10)

where \( a, \lambda, \mu \) are constants to be determined later.

**Step 3.** Substitute Equation (2.4) along Equation (2.5) into Equation (2.3) and collecting all the terms of the same power \( \exp(-m\varphi(\xi)) \), \( m = 0, 1, 2, 3, \ldots \) and equating them to zero, we obtain a system of algebraic equations, which can be solved by Maple or Mathematica to get the values of.

**Step 4.** Substituting these values and the solutions of Equation (2.5) into Equation (2.3) we obtain the exact solutions of Equation (2.1).

### 3. Application

#### 3.1. Example 1: Nano-Solitons of Ionic Wave's Propagation along Microtubules in Living Cells [27]

We first consider an inviscid, incompressible and non-rotating flow of fluid of constant depth \((h)\). We take the direction of flow as \(x\)-axis and \(z\)-axis positively upward the free surface in gravitational field. The free surface elevation above the undisturbed depth \(h\) is \(\eta(x,t)\), so that the wave surface at height \(z = h + \eta(x,t)\), while \(z = 0\) is horizontal rigid bottom.

Let \(\varphi(x,z,t)\) be the scalar velocity potential of the fluid lying between the bottom \((z = 0)\) and free space \(\eta(x,t)\), then we could write the Laplace and Euler equation with the boundary conditions at the surface and the bottom, respectively, as follows:

\[
\frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial z^2} = 0; \quad 0 < z < h + \eta; \quad -\infty < x < +\infty
\]

(3.1)

\[
\frac{\partial \varphi}{\partial t} + \frac{1}{2} \left( \frac{\partial \varphi}{\partial z} \right)^2 + g \eta = 0; \quad z = h + \eta
\]

(3.2)

\[
\frac{\partial \eta}{\partial t} + \frac{\partial \varphi}{\partial x} = 0,
\]

(3.3)

\[
\frac{\partial \varphi}{\partial z} = 0; \quad z = 0.
\]

(3.4)

It is useful to introduce two following fundamental dimensionless parameters:

\[
\sigma = \frac{\eta_0}{h} < 1; \quad \delta = \left( \frac{h}{l} \right)^2 < 1,
\]

(3.5)

where \(\eta_0\) is the wave amplitude, and \(l\) is the characteristic length-like wavelength. Accordingly, we also take a complete set of new suitable non-dimensional variables:

\[
\chi = \frac{x}{l}; \quad Z = \frac{z}{h}; \quad T = \frac{ct}{l}; \quad \psi = \frac{\eta}{\eta_0}; \quad \phi = \frac{h}{\eta_0} \varphi,
\]

(3.6)

where \(c = \sqrt{gh}\) is the shallow-water wave speed, with \(g\) being gravitational acceleration. In term of (3.5) and (3.6) the initial system of Equations (3.1)-(3.4) now reads

\[
\delta \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial z^2} = 0;
\]

(3.7)

\[
\frac{\partial \phi}{\partial \tau} + \frac{\sigma}{2} \left( \frac{\partial \phi}{\partial x} \right)^2 + \frac{\sigma}{2\delta} \left( \frac{\partial \phi}{\partial x} \right)^2 + \psi = 0; \quad Z = 1 + \sigma \psi,
\]

(3.8)
\[
\frac{\partial \psi}{\partial \tau} + \sigma \left( \frac{\partial \phi}{\partial \chi} \right) - \frac{1}{\delta} \left( \frac{\partial \phi}{\partial \zeta} \right) = 0; \quad Z = 1 + \sigma \nu, \quad (3.9)
\]

\[
\frac{\partial \phi}{\partial \zeta} = 0; \quad z = 0. \quad (3.10)
\]

Expanding \( \phi(x,t) \) in terms of \( \delta \)
\[
\phi = \phi_0 + \delta \phi_1 + \delta^2 \phi_2, \quad (3.11)
\]

and using the dimensionless wave particles velocity in \( x \)-direction, by definition \( u = \frac{\partial \phi}{\partial \chi} \), then substituting of (3.11) into (3.7)-(3.9), with retaining terms up to linear order of small parameters \((\delta, \sigma)\) in (3.8), and second order in (3.9), we get

\[
\frac{\partial \phi_0}{\partial \tau} + \frac{\delta}{2} \left( \frac{\partial^2 u}{\partial \zeta} \right) + \nu + \frac{1}{2} \nu^2 = 0, \quad (3.12)
\]

\[
\frac{\partial \psi}{\partial \tau} + \sigma u \left( \frac{\partial \psi}{\partial \chi} \right) + \frac{1}{\delta} \left( 1 + \nu \right) \frac{\partial u}{\partial \chi} = \delta \frac{\partial^2 u}{\partial \chi^2}, \quad (3.13)
\]

Making the differentiation of (3.12) with respect to \( \chi \), and rearranging (3.13), we get

\[
\frac{\partial u}{\partial \tau} + \sigma u \left( \frac{\partial u}{\partial \chi} \right) + \frac{\partial \psi}{\partial \chi} \left[ u \left( 1 + \nu \right) \right] - \frac{1}{\delta} \frac{\partial^2 u}{\partial \chi^2} = 0, \quad (3.14)
\]

\[
\frac{\partial \psi}{\partial \tau} + \frac{\partial}{\partial \chi} \left[ u \left( 1 + \nu \right) \right] - \frac{1}{6} \frac{\partial^3 u}{\partial \chi^3} = 0, \quad (3.15)
\]

Returning back to dimensional variables \( \eta(x,t) \) and \( \nu = \frac{\partial \phi}{\partial x} \), (3.14) now reads

\[
\frac{\partial \nu}{\partial \tau} + u \left( \frac{\partial \nu}{\partial \chi} \right) + g \frac{\partial \eta}{\partial \chi} = -\frac{1}{3} \frac{\partial ^3 u}{\partial \chi^3}, \quad (3.16)
\]

We could define the new function \( V(x,t) \) unifying the velocity and displacement of water particles as follows:

\[
\nu = \frac{1}{h} \left( \frac{\partial V}{\partial t} \right); \quad \eta = \frac{\partial V}{\partial x}, \quad (3.17)
\]

implying that (3.16) becomes

\[
\frac{\partial^2 V}{\partial t^2} - gh \frac{\partial^2 V}{\partial x^2} + \frac{1}{2h} \frac{\partial^2 \nu}{\partial \chi^2} = \frac{1}{3} \frac{\partial^3 u}{\partial \chi^3}, \quad (3.18)
\]

We seek for traveling wave solutions with moving coordinate of the form \( \xi = x - \nu t \) and with wave speed \( \nu \), which reduces Equation (3.18) into ordinary nonlinear differential equation as follows:

\[
\left( \nu^2 - gh \right) \frac{\partial^2 V}{\partial \xi^2} + \frac{\nu^2}{2h} \frac{\partial \nu}{\partial \xi} \left( \frac{\partial V}{\partial \xi} \right)^2 = \frac{1}{3} \frac{\partial^3 u}{\partial \xi^3}, \quad (3.19)
\]

Integrating Equation (3.19) once, and setting \( \frac{\partial V}{\partial \xi} = W \), we get

\[
\frac{\partial^2 W}{\partial \xi^2} = \alpha W^2 + \beta W + c_1, \quad (3.20)
\]

Balancing \( W^* \) and \( W^2 \) yields, \( N + 2 = 2N \Rightarrow N = 2 \). Therefore, we can write the solution of Equation
Substituting (3.21) along (3.23) into (3.20), setting the coefficients of $\exp(-4\phi(x))$, $\exp(-3\phi(x))$, $\exp(-2\phi(x))$, $\exp(-\phi(x))$, and $\exp(0\phi(x))$ to zero, we obtain the following underdetermined system of algebraic equations for $(a_0, a_1, a_2)$:

\begin{align}
6a_2 - a_0\alpha^2 &= 0, \\
2a_1 + 10a_0\lambda - 2\alpha a_0a_2 &= 0, \\
3a_0\lambda + 8a_0\alpha + 4a_0\lambda^2 - 2\alpha a_0 - \alpha a_2^2 - 2\beta a_2 &= 0, \\
2a_2 + a_0\lambda + 6\alpha a_0\alpha - 2\alpha a_0 - \beta a_1 &= 0, \\
\gamma a_0\lambda + 2a_0\lambda^2 - \alpha a_2^2 - 2\beta a_2 - c_3 &= 0.
\end{align}

Solving the above system with the aid of Mathematica or Maple, we have the following solution:

\[
c_0 = \frac{-3a_0^2 + 24a_0\alpha a_2 + 2a_0^2\beta a_2^2 + 144a_0^2a_2^2 - 8\beta a_0a_2^2 - 2\beta^2 a_2^2 - 192a_2^2}{32a_2},
\]

\[
\mu = \frac{a_0^2 + 12a_0a_2 + \beta a_2^2}{8a_2}, \quad a_0 = a_0, \quad a_1 = \frac{6}{\alpha}, \quad a_2 = \frac{6\lambda}{\alpha}.
\]

So that the solution of Equation (3.20) will be in the form:

\[
W(\xi) = a_0 + \frac{6}{\alpha} \exp(-\phi(\xi)) + \frac{6\lambda}{\alpha} \exp(-2\phi(\xi)),
\]

Consequently, the solution takes the forms:

When $\lambda^2 - 4\mu > 0, \mu \neq 0$,

\[
u = a_0 + \frac{6}{\alpha} + \frac{2\mu}{\sqrt{\lambda^2 - 4\mu}} \frac{\exp\left(\frac{\sqrt{\lambda^2 - 4\mu}}{2}(\xi + C)\right)}{\exp\left(\frac{\lambda}{2} + C\right)} + a_0 + \frac{6\lambda}{\alpha} \frac{2\mu - \sqrt{\lambda^2 - 4\mu} \tanh\left(\frac{\sqrt{\lambda^2 - 4\mu}}{2}(\xi + C)\right) - \lambda}{\lambda}.
\]

When $\lambda^2 - 4\mu > 0, \mu = 0$,

\[
u = a_0 + \frac{6}{\alpha} \frac{\lambda}{\exp\left(\lambda(\xi + C)\right) - 1} + a_0 + \frac{6\lambda}{\alpha} \frac{\lambda}{\exp\left(\lambda(\xi + C)\right) - 1}.
\]

When $\lambda^2 - 4\mu = 0, \mu \neq 0, \lambda \neq 0$,

\[
u = a_0 + \frac{6}{\alpha} \frac{2(\lambda(\xi + C) + 2)}{\lambda^2(\xi + C)} + a_0 + \frac{6\lambda}{\alpha} \frac{2(\lambda(\xi + C) + 2)}{\lambda^2(\xi + C)}.
\]
When $\lambda^2 - 4\mu = 0, \mu = 0, \lambda = 0$,

$$u = a_0 + \frac{6}{\alpha} \frac{1}{\varepsilon + C_i} + \frac{6\lambda}{\alpha} \left( \frac{1}{\varepsilon + C_i} \right)^2,$$

(3.33)

When $\lambda^2 - 4\mu < 0$,

$$u = a_0 + \frac{6}{\alpha} \frac{2\mu}{\sqrt{4\mu - \lambda^2}} \tan \left( \frac{\sqrt{4\mu - \lambda^2}}{2} \left( \varepsilon + C_i \right) - \lambda \right) + \frac{6\lambda}{\alpha} \left( \frac{2\mu}{\sqrt{4\mu - \lambda^2}} \tan \left( \frac{\sqrt{4\mu - \lambda^2}}{2} \left( \varepsilon + C_i \right) - \lambda \right) \right)^2,$$

(3.34)

3.2. Example 2. Nano-Ionic Currents of MTs

The Nano-ionic currents are elaborated in [27] take the form

$$\frac{I^2}{3} = \frac{2}{l} \left( x c_0 - 2s s_0 \right) u u' + 2u + \frac{2\varepsilon c_0}{l} u'_i + \frac{1}{l} \left( R \varepsilon^{-1} - G_0 \right) z u = 0,$$

(3.35)

where $R = 0.34 \times 10^9 \Omega$ is the resistance of the ER with length, $l = 8 \times 10^{-9} m, c_0 = 1.8 \times 10^{-15} F$ is the maximal capacitance of the ER, $G_0 = 1.1 \times 10^{-13} si$ is conductance of pertaining NPs and $z = 5.56 \times 10^{10} \Omega$ is the characteristic impedance of our system parameters $\delta$ and $\chi$ describe nonlinearity of ER capacitor and conductance of NPs in ER, respectively. In order to solve Equation (3.35) we use the travelling wave transformations $u(x,t) = u(\xi), \quad \xi = \frac{1}{l} x - \frac{C}{\tau} t$, with $\tau = RC_0 = 0.6 \times 10^{-6} s$, to reduce Equation (3.35) to the following nonlinear ordinary differential equation:

$$\frac{1}{3} u'' + \frac{2}{\tau} \left( x c_0 - 2s s_0 \right) u u' + \left( 2 - \frac{c_e c_0}{\tau} \right) u' + \left( \frac{R \varepsilon^{-1} - G_0 \varepsilon}{\varepsilon} \right) u = 0,$$

(3.36)

Which can be written in the form

$$\frac{1}{3} u'' + H_1 u u' + H_2 u' + H_3 u = 0,$$

(3.37)

where

$$H_1 = \frac{c_e}{\tau} B, H_2 = \left( 2 - \frac{c_e c_0}{\tau} \right), B = - \varepsilon \frac{3}{2} \left( x c_0 - 2s s_0 \right), \quad E = c_e \varepsilon, \quad D = H_3,$$

(3.38)

Thus Equation (3.37) take the form

$$\frac{1}{3} u'' + \frac{c_e}{\tau} B u u' + \left( 2 - \frac{c_e}{\tau} \right) u' + D u = 0,$$

(3.39)

Balancing $u''$ and $u u'$ yields, $N + 3 = N + N + 1 \rightarrow N = 2$. Consequently, we get

$$u = a_0 + a_1 e^{-\phi(\xi)} + a_2 e^{2\phi(\xi)},$$

(3.40)

Where $a_0, a_1, a_2$ are arbitrary constants such that $a_2 \neq 0$. From Equation (3.40), it is easy to see that
Substituting Equations (3.40)-(3.42) into Equation (3.39) and equating the coefficients of \( \exp(-5\varphi(\xi)) \), \( \exp(-4\varphi(\xi)) \), \( \exp(-3\varphi(\xi)) \), \( \exp(-2\varphi(\xi)) \), \( \exp(-1\varphi(\xi)) \), \( \exp(0\varphi(\xi)) \) to zero, we obtain

\[
-8a_2 - 2\frac{cBa_2^2}{\tau} = 0,
\]

\[
-2a_1 - 18a_2 \lambda + \frac{cB(-3a_3a_2 - 2a_2^2 \lambda)}{\tau} = 0,
\]

\[
-\frac{38}{3}a_2^2 \lambda^2 - 4a_2 \lambda - \frac{40}{3}a_3 \mu + \frac{cB(-2a_2a_2 - a_2^3 - 3a_3a_2 \lambda - 2a_2^2 \mu)}{\tau} - 2\left(2 - \frac{cE}{\tau}\right)a_2 = 0,
\]

\[
-\frac{8}{3}a_2 \mu - \frac{8}{3}a_2^2 \lambda^3 - \frac{7}{3}a_2 \lambda^2 - \frac{52}{3}a_2 \mu \lambda + cB(-a_3a_1 - 2a_3a_2 \lambda - a_2^2 \lambda - 3a_3a_2 \mu)
\]

\[
+ \frac{2 - \frac{cE}{\tau}}{\tau}(-a_2^3 - 2a_2 \lambda) + (D)a_2 = 0,
\]

\[
-\frac{1}{3}a_1 \lambda^3 - \frac{14}{3}a_2 \mu \lambda^2 - \frac{8}{3}a_1 \lambda \mu - \frac{16}{3}a_2 \mu^2
\]

\[
+ \frac{2 - \frac{cE}{\tau}}{\tau}(-a_2^3 - 2a_2 \lambda) + (D)a_1 = 0,
\]

\[
-\frac{2}{3}a_1 \mu^2 - 2a_2 \mu \lambda - \frac{1}{3}a_1 \lambda^2 \mu - \frac{cBa_2a_1 \mu}{\tau} - \left(2 - \frac{cE}{\tau}\right)a_3 \mu + (D)a_0 = 0,
\]

Solving above system with the aid of Mathematica or Maple, we have the following solution:

\[
B = -\frac{\tau}{ca_2}, \quad D = 0, \quad \lambda = \frac{a_1}{a_2},
\]

\[
a_0 = -\frac{1}{12} \frac{-\tau a_2^3 - 8a_2^2 \mu \tau - 6a_2 \tau cE + 3a_2^2 cE}{a_2 \tau},
\]

\( a_1 = a_1, \ a_2 = a_2. \)

So that the solution of Equation (3.39) will be in the form:
E. H. M. Zahran

\[ u = -\frac{1}{12} - \frac{\tau a_i^2 - 8a_i^2 \mu \tau - 6a_i^2 \tau + 3a_i^2 cE}{a_i \tau} + a_i \exp(-\phi(\xi)) + a_i \exp(-2\phi(\xi)), \quad (3.49) \]

Consequently, the solution take the forms:

When \( \lambda^2 - 4\mu > 0, \mu \neq 0 \),

\[ u = -\frac{1}{12} - \frac{\tau a_i^2 - 8a_i^2 \mu \tau - 6a_i^2 \tau + 3a_i^2 cE}{a_i \tau} + a_i \left( \frac{2\mu}{-\sqrt{\lambda^2 - 4\mu} \tanh \left( \frac{\lambda^2 - 4\mu}{2} (\xi + C_1) - \lambda \right)} \right)^2 \]

\[ + a_i \left( \frac{2\mu}{-\sqrt{\lambda^2 - 4\mu} \tanh \left( \frac{\lambda^2 - 4\mu}{2} (\xi + C_1) - \lambda \right)} \right)^2 \]

\[ + a_i \left( \frac{2\mu}{-\sqrt{\lambda^2 - 4\mu} \tanh \left( \frac{\lambda^2 - 4\mu}{2} (\xi + C_1) - \lambda \right)} \right)^2 \]

\[ (3.50) \]

When \( \lambda^2 - 4\mu > 0, \mu = 0 \),

\[ u = -\frac{1}{12} - \frac{\tau a_i^2 - 8a_i^2 \mu \tau - 6a_i^2 \tau + 3a_i^2 cE}{a_i \tau} + a_i \left( \frac{\lambda}{\exp(\lambda(\xi + C_1)) - 1} \right) + a_i \left( \frac{\lambda}{\exp(\lambda(\xi + C_1)) - 1} \right)^2, \quad (3.51) \]

When \( \lambda^2 - 4\mu = 0, \mu = 0, \lambda = 0 \),

\[ u = -\frac{1}{12} - \frac{\tau a_i^2 - 8a_i^2 \mu \tau - 6a_i^2 \tau + 3a_i^2 cE}{a_i \tau} - a_i \left( \frac{2\lambda(\xi + C_1) + 2}{\lambda^2 (\xi + C_1)} \right)^2 + a_i \left( \frac{2\lambda(\xi + C_1) + 2}{\lambda^2 (\xi + C_1)} \right)^2, \quad (3.52) \]

When \( \lambda^2 - 4\mu < 0, \)

\[ u = -\frac{1}{12} - \frac{\tau a_i^2 - 8a_i^2 \mu \tau - 6a_i^2 \tau + 3a_i^2 cE}{a_i \tau} + a_i \left( \frac{\sqrt{4\mu - \lambda^2} \tan \left( \frac{\sqrt{4\mu - \lambda^2}}{2} (\xi + C_1) - \lambda \right)} \right)^2 \]

\[ + a_i \left( \frac{2\mu}{\sqrt{4\mu - \lambda^2} \tan \left( \frac{\sqrt{4\mu - \lambda^2}}{2} (\xi + C_1) - \lambda \right)} \right)^2 \]

\[ (3.54) \]

4. Results and Conclusion

In nanobiosciences the transmission line models for ionic waves propagating along microtubules in living cells play an important role in cellular signaling where ionic wave’s propagating along microtubules in living cells shaped as nanotubes that are essential for cell motility, cell division, intracellular trafficking and information processing within neuronal processes. Ionic waves propagating along microtubules in living cells have been also implicated in higher neuronal functions, including memory and the emergence of consciousness and we presented an inviscid, incompressible and non-rotating flow of fluid constant depth (h). The \( \exp(-\phi(\xi)) \) expansion method has been successfully used to find the exact traveling wave solutions of some nonlinear evolution equations and Figure 1 and Figure 2 show the solitary wave solution of both equations. As an application,
Figure 1. Solution of Equations (3.30)-(3.34). (a) Equation (3.30); (b) Equation (3.31); (c) Equation (3.32); (d) Equation (3.33); (e) Equation (3.34).
Figure 2. Solution of Equations (3.50)-(3.54). (a) Equation (3.50); (b) Equation (3.51); (c) Equation (3.52); (d) Equation (3.53); (e) Equation (3.54)
the traveling wave solutions. As an application, the traveling wave solutions for Nano-ionic solitons wave’s propagation along microtubules in living cells and Nano-ionic currents of MTs, which have been constructed using the \(\exp(-\varphi(\xi))\)-expansion method. Let us compare our results obtained in the present article with the well-known results obtained by other authors using different methods as follows: Our results of Nano-ionic solitons wave’s propagation along microtubules in living cells and Nano-ionic currents of MTs [27]. It can be concluded that this method is reliable and propose a variety of exact solutions NPDEs. The performance of this method is effective and can be applied to many other nonlinear evolution equations.
