Abstract

In the paper, the homoclinic (heteroclinic) breather limit method (HBLM) is applied to seek rogue wave solution of the Benjamin Ono equation. We find that the rational breather wave solution is just a rogue wave solution. This result shows that rogue wave can come from the extreme behavior of the breather solitary wave for (1+1)-dimensional nonlinear wave fields.

Keywords

Benjamin Ono Equation, Extended Homoclinic Test Method, Homoclinic (Heteroclinic) Breather Limit Method, Rogue Wave Solution

1. Introduction

As is well known that solitary wave solutions of nonlinear evolution equations play an important role in nonlinear science fields, especially in nonlinear physical science, since they can provide much physical information and more insight into the physical aspects of the problem and thus lead to further applications [1]. In this paper, we will consider the Benjamin Ono (BO) equation

\[ u_{tt} + \beta u_x + \gamma (u^2)_{xx} + \gamma u_{xxxx} = 0 \]

where \( \beta \) and \( \gamma \) are non-zero constants. The BO equation is one of the important nonlinear model in physics [2] [3]. By means of traveling wave method, the exact solutions of the BO equation were obtained. Using the F-expansion method and the Jacobi elliptic function expansion method to the BO equation, a series of periodic wave solutions were got [4]. Based on an improved projective Riccat equation method, the traveling wave solutions of single variable were found [5]. Applying the bilinear method and extended homoclinic test approach [6]-[10], periodic solitary wave and doubly periodic solutions for the BO equation were obtained [11].
In recent years, rogue waves, as a special type of nonlinear waves and also known as freak waves, monster waves, killer waves, extreme waves, abnormal waves [12], have triggered much interest in various physical branches. Rouge wave is a kind of wave that seems abnormal which is first served in the deep ocean. It always has two to three times amplitude higher than its surrounding waves and generally forms in a short time for which people think that it comes from nowhere. Rouge waves have been the subject of intensive research in oceanography [13] [14], optical fibers [15]-[17], superfluids [18], Bose-Einstein condensates, financial markets and other related fields [19]-[22]. In this work, we will apply the homoclinic (heteroclinic) breather limit method (HBLM) [23], to seek rogue wave solution of the BO equation. We take the following four steps:

Step 1
By Painleve analysis, a transformation \( u = T(f) \) is made for some new and unknown function \( f \).

Step 2
By using the transformation in step 1, original equation can be converted into Hirota’s bilinear form \( G(D_t, D_x, f) = 0 \), where the \( D \)-operator [24] is defined by

\[
D^n(D^m f(x,t)g(x,t) = \left( \frac{\partial}{\partial x} - \frac{\partial}{\partial x'} \right)^n \times \left( \frac{\partial}{\partial t} - \frac{\partial}{\partial t'} \right)^m f(x,t)g(x',t') \bigg|_{x=x',t=t'}
\]

Step 3
Solve the above equation to get homoclinic (heteroclinic) breather wave solution by using extended homoclinic test approach (EHTA) [25].

Step 4
Let the period of periodic wave go to infinite in homoclinic (heteroclinic) breather wave solution, we can obtain a rational homoclinic (heteroclinic) wave and this wave is just a rogue wave.

2. Rational Breather Wave (Rogue Wave)

The BO equation,

\[
u_{tt} + \beta u_{xxxx} + \gamma u_{xxxx} = 0
\]

By Painleve analysis, let

\[
u = u_0 + \frac{6\gamma}{\beta} (\ln f)_{xx}
\]

where \( f(x,t) \) is unknown real function, and \( u_0 \) is the small perturbation parameter. Substituting (2) into (1) will get the following equation:

\[
\frac{6\gamma}{\beta} (\ln f)_{xx} + 12\gamma u_0 (\ln f)_{xx} + \frac{36\gamma^2}{\beta} ((\ln f)_{xx})^2 + \frac{6\gamma^2}{\beta} (\ln f)_{xxxx} = 0
\]

By means of the hirota bilinear operator, which is defined by

\[
D^n(D^m f(x,t)g(x,t) = \left( \frac{\partial}{\partial x} - \frac{\partial}{\partial x'} \right)^n \times \left( \frac{\partial}{\partial t} - \frac{\partial}{\partial t'} \right)^m f(x,t)g(x',t') \bigg|_{x=x',t=t'}
\]

we will get

\[
\frac{\partial^2}{\partial x^2}(\ln f) = \frac{D_x^2(f \cdot f)}{2f^2}
\]

\[
\frac{\partial^4}{\partial x^4}(\ln f) = \frac{D_x^4(f \cdot f)}{2f^2} - \frac{3}{2} \left( \frac{D_x^2(f \cdot f)}{f^2} \right)^2
\]

Putting (5) (6) into (3) implies the following bilinear equation:

\[
(D^2_t + \beta u_0 D^2_x + \gamma D^4_t)(f \cdot f) = 0
\]

In this case we choose extended homoclinic test function
\[ f = e^{-p_1(x-w_1t)} + c_1 \cos p_2(x+w_2t) + c_2 e^{p_1(x-w_1t)} \]  

(8)

where \( p_1, p_2, w_1, w_2, c_1 \) and \( c_2 \) are real constants to be determined.

Substituting Equation (8) into (7), collecting coefficients of the terms \( e^{-p_1(x-w_1t)} \), \( e^{p_1(x-w_1t)} \), \( \sin p_2(x+w_2t) \), \( \cos p_2(x+w_2t) \) and the constant, and let coefficients of these terms to zero, we get an algebraic equation

\[
\begin{align*}
2c_1p_1p_2w_1w_2 - 4\beta u_0 c_1p_1p_2 + 4\gamma c_1p_1p_2 (-p_1^2 + p_2^2) &= 0 \\
-2c_1p_1p_2w_1w_2 + 4\beta u_0 c_1p_1p_2 + 4\gamma c_1c_2p_1p_2 (p_1^2 - p_2^2) &= 0 \\
c_1c_2 (p_1^2w_1^2 - p_2^2w_2^2) + 2\beta u_0 c_1c_2 (p_1^2 - p_2^2) + \gamma c_1c_2 (p_1^4 + p_2^4) - 6\gamma c_1c_2 p_1^2 p_2^2 &= 0 \\
4\gamma c_1p_1^4 - 2\beta c_1^2p_1^2w_0 + 16\gamma c_1p_1^4 - c_1^2p_1^2w_2^2 + 8\beta c_1^2p_1^2w_0 + 4c_2p_1^2w_2^2 &= 0 \\
\gamma c_1p_1^4 - 6\gamma c_1p_1^2p_2^2 + \gamma c_1p_1^2 - 2\beta c_1^2p_1^2w_0 + c_1p_1^2w_2^2 - c_1^2p_1^2w_2^2 &= 0
\end{align*}
\]

(9)

Solving Equation (9), then taking \( p_2 = p_1 \), we have

\[
c_1 = \pm \sqrt{\frac{2\gamma p_1^3 w_1^2 + 2\beta^2 u_0^2 + \beta u_0^2 w_2^2}{-4\gamma p_1^3 w_2^2 + 2\beta^2 u_0^2 + \beta u_0^2 w_2^2}}, \quad w_1w_2 = 2\beta u_0, \quad p_1^2 = \frac{1}{4\gamma} (w_1^2 - w_2^2)
\]

(10)

where \( w_1, w_2, c_2 \) are some free real constants. Choosing \( \beta u_0 \neq 0 \) and \( c_2 > 0 \), we get \( \left| w_1 \right| > \left| w_2 \right| \).

Substituting (10) into (8), we get

\[
f_1(x,t) = 2\sqrt{c_2} \cosh \left( p_1 \left( x - \frac{2\beta u_0}{w_2} t \right) + \ln \sqrt{c_2} \right) + h_1 \cos \left( p_2 \left( x + w_2 t \right) \right),
\]

and \( f_2(x,t) = 2\sqrt{c_2} \cosh \left( p_1 \left( x - \frac{2\beta u_0}{w_2} t \right) + \ln \sqrt{c_2} \right) - h_1 \cos \left( p_2 \left( x + w_2 t \right) \right) \)

(11)

where \( h_1 = 2\sqrt{\frac{2\gamma p_1^3 w_1^2 + 2\beta^2 u_0^2 + \beta u_0^2 w_2^2}{-4\gamma p_1^3 w_2^2 + 2\beta^2 u_0^2 + \beta u_0^2 w_2^2}} \), \( p_1 = \pm \sqrt{\frac{w_1^2 - w_2^2}{\gamma}} \), \( w_1, w_2 \in \mathbb{R} \). Substituting (11) into (2) yields the solutions of (1) as follows, respectively

\[
u_1(x,t) = u_0 + \frac{6\gamma}{\beta} \left[ -4h_1 p_1^2 2\sqrt{c_2} \sinh \left( p_1 \left( x - \frac{2\beta u_0}{w_2} t \right) + \ln \sqrt{c_2} \right) \sin \left( p_2 \left( x + w_2 t \right) \right) - h_1^2 p_1^2 + 4c_2 p_1^2 \right]
\]

(12)

\[
u_2(x,t) = u_0 + \frac{6\gamma}{\beta} \left[ -4h_1 p_1^2 2\sqrt{c_2} \sinh \left( p_1 \left( x - \frac{2\beta u_0}{w_2} t \right) + \ln \sqrt{c_2} \right) \sin \left( p_2 \left( x + w_2 t \right) \right) - h_1^2 p_1^2 + 4c_2 p_1^2 \right]
\]

(13)

The solution \( \nu_1(x,t) \) (or \( \nu_2(x,t) \)) shows a new family of two-wave, breather solitary wave, which is a solitary wave and also is a periodic wave.

Substituting \( c_2 = 1 \) into the solution \( \nu_1(x,t) \), it can be rewritten as follows

\[
u_1(x,t) = u_0 + \frac{p_1^2}{\beta} \left[ -k_1^2 - 2k_1 \sinh \left( p_1 \left( x - \frac{2\beta u_0}{w_2} t \right) \right) \sin \left( p_2 \left( x + w_2 t \right) \right) \right]
\]

(14)
where \( k_i = \sqrt{\frac{2\gamma p_1^2 w_2^2 + 2\beta^2 u_0^2 + \beta u_0 w_2^2}{-4\gamma p_1^2 w_2^2 + 2\beta^2 u_0^2 + \beta u_0 w_2^2}} \) (see Figure 1).

Now we consider a limit behavior of \( u_2(x,t) \) as the period \( \frac{2\pi}{p_1} \) of periodic wave \( \cos(p_1(x + w_2t)) \) goes to infinite, i.e. \( p_1 \to 0 \). By computing, we get the following result

\[
U_{\text{roguewave}} = u_0 + \frac{24\gamma R - 2\left( x - \frac{2\beta u_0}{w_2}t \right) \left( x + w_2t \right)}{\beta \left( \frac{x - 2\beta u_0}{w_2}t \right)^2 + (x + w_2t)^2 + R} \tag{15}
\]

where \( R = \frac{-6\gamma w_2^2}{2\beta^2 u_0^2 + \beta u_0 w_2^2} \), and \( k_1 \to 0 \) and \( w_1 = w_2 \) as \( p_1 \to 0 \) (see Figure 2).

Especially, if let \( u_0 = 0 \), we will get \( c_2 < 0 \), so the two breather wave solution can not be obtained, meanwhile, the rational breather wave solution (rogue wave solution) can’t also be find. The small perturbation parameter \( u_0 = 0 \) plays a huge part in finding rouge wave solution.

**Figure 1.** The figure of \( u_2(x,t) \) as \( u_0 = \frac{1}{6}, \beta = 6, \gamma = -1 \).

**Figure 2.** The figure of \( U_{\text{roguewave}} \) as \( u_0 = \frac{1}{6}, \beta = 6, \gamma = -1 \).
Equation (15) is a rational solution of Equation (1), and it is also a breather-type solution. \( U \rightarrow 0 \) for fixed \( t \) as \( x \rightarrow \pm \infty \). So, the solution \( U_{\text{rogue}} \) is a rogue wave solution which has two to three times amplitude higher than its surrounding waves and forms in a short time. One may think that whether the energy collection and superposition of breather solitary wave in many periods lead to a rogue wave or not.

3. Conclusion

In the paper, we apply the homoclinic (heteroclinic) breather limit method (HBLM) to find the BO equation’s breather solitary solution and rational breather solution. Meanwhile, rational breather solution obtained here is just a rogue wave solution of the BO equation. Furthermore, the small perturbation parameter \( u_0 \) plays an important role in seeking rogue wave solution too. Next, we will try to use some methods to look for multi-rogue waves, such as the two-order wronskian determinant, Darboux transformation and so on.
