Abstract

In 1980 F. Wattenberg constructed the Dedekind completion $^\ast\mathbb{R}_d$ of the Robinson non-archimedean field $^\ast\mathbb{R}$ and established basic algebraic properties of $^\ast\mathbb{R}_d$. In 1985 H. Gonshor established further fundamental properties of $^\ast\mathbb{R}_d$. In [4] important construction of summation of countable sequence of Wattenberg numbers was proposed and corresponding basic properties of such summation were considered. In this paper the important applications of the Dedekind completion $^\ast\mathbb{R}_d$ in transcendental number theory were considered. Given any analytic function of one complex variable $f \in \mathbb{Q}[[z]]$, we investigate the arithmetic nature of the values of $f(z)$ at transcendental points $e^n, n \in \mathbb{N}$. Main results are: 1) the both numbers $e^\pi$ and $e \times \pi$ are irrational; 2) number $e^\pi$ is transcendental. Nontrivial generalization of the Lindemann-Weierstrass theorem is obtained.

Keywords

Non-Archimedean Analysis, Robinson Non-Archimedean Field, Dedekind Completion, Dedekind Hyperreals, Wattenberg Embeding, Gonshor Idempotent Theory, Gonshor Transfer
1. Introduction

In 1873 French mathematician, Charles Hermite, proved that $e$ is transcendental. Coming as it did 100 years after Euler had established the significance of $e$, this meant that the issue of transcendence was one mathematicians could not afford to ignore. Within 10 years of Hermite’s breakthrough, his techniques had been extended by Lindemann and used to add $\pi$ to the list of known transcendental numbers. Mathematician then tried to prove that other numbers such as $e+\pi$ and $e\times\pi$ are transcendental too, but these questions were too difficult and so no further examples emerged till today's time. The transcendence of $e\pi$ has been proved in 1929 by A. O. Gel’fond.

Conjecture 1. Whether the both numbers $e+\pi$ and $e\times\pi$ are irrational.

Conjecture 2. Whether the numbers $e$ and $\pi$ are algebraically independent.

However, the same question with $e\pi$ and $\pi$ has been answered:

Theorem. (Nesterenko, 1996 [1]) The numbers $e\pi$ and $\pi$ are algebraically independent.

Throughout of 20-th century, a typical question: whether $(\lambda_1, \lambda_2, \ldots, \lambda_n)\neq(1, -1, -2, \ldots)$, is transcendental number for each algebraic number $\lambda_i\in\mathbb{Q}$ has been investigated and answered many authors. Modern result in the case of entire functions satisfying a linear differential equation provides the strongest results, related with Siegel’s $E$-functions [1] [2], ref [1] contains references to the subject before 1998, including Siegel $E$ and $G$ functions.

Theorem. (Siegel C. L.) Suppose that

$$\sum_{n=0}^{\infty} \frac{x^n}{(\lambda_1+1)(\lambda_2+2)\cdots(\lambda_n+n)} = 0.$$  \hspace{1cm} (1.1)

Then $\varphi\lambda(x)$ is a transcendental number for each algebraic number $\lambda \neq 0$.

Let $f$ be an analytic function of one complex variable $f \in \mathbb{Q}[x]$.

Conjecture 3. Whether $f(\alpha)$ is an irrational number for given transcendental number $\alpha$.

Conjecture 4. Whether $f(\alpha)$ is a transcendental number for given transcendental number $\alpha$.

In this paper we investigate the arithmetic nature of the values of $f(\alpha)$ at transcendental points $e^n, n \in \mathbb{N}$.

Definition 1.1. Let $g(x) : \mathbb{R} \to \mathbb{R}$ be any real analytic function such that

$$g_0(x) = \sum_{n=0}^{\infty} q_n x^n, |x| < r, \forall n \in \mathbb{Q}.$$

We will call any function given by Equation (1.2) $\mathbb{Q}$-analytic function and denoted by $g_0(x)$.

Definition 1.2. [3] [4]. A transcendental number $z \in \mathbb{R}$ is called $\#\$-transcendental number over the field $\mathbb{Q}$, if there does not exist $\mathbb{Q}$-analytic function $g_0(x)$ such that $g_0(z) = 0$, i.e. for every $\mathbb{Q}$-analytic function $g_0(x)$ the inequality $g_0(z) \neq 0$ is satisfies.

Definition 1.3. [3] [4]. A transcendental number $z$ is called $w\#$-transcendental number over the field $\mathbb{Q}$, i.e. there exists $\mathbb{Q}$-analytic function $g_0(x)$ such that $g_0(z) = 0$.

Example. Number $\pi$ is transcendental but number $\pi$ is not $\#\$-transcendental number over the field $\mathbb{Q}$ as

(1) $\sin x$ is a $\mathbb{Q}$-analytic and

(2) $\sin \left(\frac{\pi}{2}\right) = 1$, i.e.

$$-1 + \frac{\pi}{2} \pi^3 + \frac{\pi^5}{2^2 5!} + \frac{\pi^7}{2^3 7!} + \cdots + \frac{(-1)^{2n+1} \pi^{2n+1}}{2^{2n+1} (2n+1)!} = 0.$$  \hspace{1cm} (1.3)

Main results are.

Theorem 1.1. [3] [4]. Number $e$ is $\#\$-transcendental over the field $\mathbb{Q}$.

From theorem 1.1 immediately follows.

Theorem 1.2. Number $e^\pi$ is transcendental.

Theorem 1.3. [3] [4]. The both numbers $e+\pi$ and $e-\pi$ are irrational.
Theorem 1.4. For any $\xi \in \mathbb{Q}$ number $e^\xi$ is $\#$-transcendental over the field $\mathbb{Q}$.

Theorem 1.5. [3] [4]. The both numbers $e^\xi$ and $e^{-\theta} \times \pi$ are irrational.

Theorem 1.6. [3] [4]. Let $f_j(z), l = 1, 2, \ldots$ be a polynomials with coefficients in $\mathbb{Z}$.

Assume that for any $l \in \mathbb{N}$ algebraic numbers over the field $\mathbb{Q} : \beta_{j,1}, \ldots, \beta_{j,l}$, $k_i \geq 1, l = 1, 2 \ldots$ form a complete set of the roots of $f_j(z)$ such that

$$f_j(z) \in \mathbb{Z}[z], \deg f_j(z) = k_i$$

and $a_j \in \mathbb{Z}, l = 1, 2, \ldots; a_n \neq 0$. Assume that

$$a_0 + \sum_{l=1}^{\infty} \left| \sum_{k=1}^{k_i} \beta_{j,k} \right| < \infty. \quad (1.5)$$

Then

$$a_0 + \sum_{l=1}^{\infty} \sum_{k=1}^{k_i} \beta_{j,k} \neq 0. \quad (1.6)$$

2. Preliminaries. Short Outline of Dedekind Hyperreals and Gonshor Idempotent Theory

Let $\mathbb{R}$ be the set of real numbers and $^*\mathbb{R}$ a nonstandard model of $\mathbb{R}$ [5]. $^*\mathbb{R}$ is not Dedekind complete. For example, $\mu(0) = \{x \in \mathbb{R} \mid x = 0\}$ and $\mathbb{R}$ are bounded subsets of $^*\mathbb{R}$ which have no suprema or infima in $^*\mathbb{R}$. Possible completion of the field $^*\mathbb{R}$ can be constructed by Dedekind sections [6] [7]. In [6] Wattenberg constructed the Dedekind completion of a nonstandard model of the real numbers and applied the construction to obtain certain kinds of special measures on the set of integers. Thus was established that the Dedekind completion $^*\mathbb{R}_d$ of the field $^*\mathbb{R}$ is a structure of interest not for its own sake only and we establish further important applications here. Important concept introduced by Gonshor [7] is that of the absorption number of an element $a \in ^*\mathbb{R}_d$ which, roughly speaking, measures the degree to which the cancellation law $a + b = a + c \Rightarrow b = c$ fails for $a$.

2.1. The Dedekind Hyperreals $^*\mathbb{R}_d$

Definition 2.1. Let $^*\mathbb{R}$ be a nonstandard model of $\mathbb{R}$ and $P(^*\mathbb{R})$ the power set of $^*\mathbb{R}$.

A Dedekind hyperreal $\alpha \in ^*\mathbb{R}_d$ is an ordered pair $\{U, V\} \in P(^*\mathbb{R}) \times P(^*\mathbb{R})$ that satisfies the next conditions:

1. $\exists x \forall y(x \in U \land y \in V)$. 2. $U \cap V = \emptyset$. 3. $\forall x(x \in U \Rightarrow \exists y(y \in V \land x < y))$.

4. $\forall x(x \in V \Rightarrow \exists y(x \in V \land x < y))$. 5. $\forall x \forall y(x < y \Rightarrow x \in U \lor y \in V)$.

Compare the Definition 2.1 with original Wattenberg definition [6],(see [6] def.2.1).

Designation 2.1. Let $\{U, V\} \triangleq \alpha \in ^*\mathbb{R}_d$. We designate in this paper

$$U \triangleq \text{cut}_U(\alpha), V \triangleq \text{cut}_V(\alpha)$$

$$\alpha \triangleq \{\text{cut}_U(\alpha), \text{cut}_V(\alpha)\}$$

Designation 2.2. Let $\alpha \in ^*\mathbb{R}$. We designate in this paper

$$\alpha^* \triangleq \text{cut}_U(\alpha), \alpha^\# \triangleq \text{cut}_V(\alpha)$$

$$\alpha \triangleq \{\alpha^*, \alpha^\#\}$$

Remark 2.1. The monad of $\alpha \in ^*\mathbb{R}$ is the set: $\{x \in ^*\mathbb{R} \mid x \equiv \alpha\}$ is denoted by $\mu(\alpha)$.

Supremum of $\mu(0)$ is denoted by $\varepsilon_d$. Supremum of $\mathbb{R}$ is denoted by $\Delta_d$. Note that [6]
\[ \varepsilon_d = (-\infty, 0] \cup \{0\}, \]
\[ \Delta_d = \bigcup_{n \in \mathbb{N}} \{(-\infty, n]\}. \]

Let \( A \) be a subset of \( \mathbb{R} \) bounded above. Then \( \sup(A) \) exists in \( \mathbb{R} \) [6].

**Example 2.1.** 1) \( \Delta_d = \sup(\varepsilon_d) \in \mathbb{R} \setminus \mathbb{R}, \) \( \varepsilon_d = \sup(0) \in \mathbb{R} \setminus \mathbb{R}. \)

**Remark 2.2.** Unfortunately the set \( \mathbb{R}_d \) inherits some but by no means all of the algebraic structure on \( \mathbb{R}. \) For example, \( \mathbb{R}_d \) is not a group with respect to addition since if \( x + r_\varepsilon \) denotes the addition in \( \mathbb{R}_d \) then:
\[ \varepsilon_d + r_\varepsilon = \varepsilon_d + r_\varepsilon + 0 = \varepsilon_d. \]
Thus \( \mathbb{R}_d \) is not even a ring but pseudo-ring only.

**Definition 2.2.** We define:
1. The additive identity (zero cut) \( 0, \mathbb{R}_d \), often denoted by \( 0^* \) or simply 0 is
\[ 0, \mathbb{R}_d = \{ x \in \mathbb{R} | x < 0 \}. \]
2. The multiplicative identity \( 1, \mathbb{R}_d \), often denoted by \( 1^* \) or simply 1 is
\[ 1, \mathbb{R}_d = \{ x \in \mathbb{R} | x < 1 \}. \]

Given two Dedekind hyperreal numbers \( \alpha, \mathbb{R}_d \) and \( \beta, \mathbb{R}_d \) we define:
3. Addition \( \alpha + r_\varepsilon \beta \) of \( \alpha \) and \( \beta \) often denoted by \( \alpha \beta + r_\varepsilon \) is
\[ \alpha \beta + r_\varepsilon = \{ x + y | x \in \alpha, y \in \beta \}. \]
It is easy to see that \( \alpha + r_\varepsilon 0, \mathbb{R}_d = \alpha \) for all \( \alpha, \mathbb{R}_d. \)

It is easy to see that \( \alpha + r_\varepsilon \beta \) is again a cut in \( \mathbb{R} \) and \( \alpha + r_\varepsilon \beta = \beta + r_\varepsilon \alpha. \)

Another fundamental property of cut addition is associativity:
\[ (\alpha + r_\varepsilon \beta) + r_\varepsilon \gamma = \alpha + r_\varepsilon (\beta + r_\varepsilon \gamma). \]
This follows from the corresponding property of \( \mathbb{R}. \)
4. The opposite \( -r_\varepsilon \alpha \) of \( \alpha \), often denoted by \( -\alpha^* \) or simply by \( -\alpha \), is
\[ -\alpha = \{ x \in \mathbb{R} | -x \in \alpha, -x \text{ is not the least element of } \mathbb{R} \setminus \alpha \}, \]
5. We say that the cut \( \alpha \) is positive if \( 0^* < \alpha \) or negative if \( \alpha < 0^* \).

The absolute value of \( \alpha \), denoted \( |\alpha| \), is \( |\alpha| = |\alpha| \) if \( \alpha \geq 0 \) and \( |\alpha| = -\alpha \) if \( \alpha \leq 0 \).
6. If \( \alpha, \beta > 0 \) then multiplication \( \alpha \times r_\varepsilon \beta \) of \( \alpha \) and \( \beta \) often denoted \( \alpha \beta + r_\varepsilon \) is
\[ \alpha \beta = \{ z \in \mathbb{R} | z = x \times y \text{ for some } x \in \alpha, y \in \beta \text{ with } x, y > 0 \}. \]
In general, \( \alpha \beta = 0 \) if \( \alpha = 0 \) or \( \beta = 0 \), \( \alpha \beta = |\alpha| \times |\beta| \) if \( \alpha > 0, \beta > 0 \) or \( \alpha < 0, \beta < 0 \), \( \alpha \beta = -(|\alpha| \times |\beta|) \) if \( \alpha > 0, \beta < 0 \) or \( \alpha < 0, \beta > 0 \).
7. The cut order enjoys on \( \mathbb{R}_d \) the standard additional properties of:
(i) transitivity: \( \alpha \leq \beta \Rightarrow \alpha \leq \gamma. \)
(ii) trichotomy: eizer \( \alpha < \beta, \beta < \alpha \) or \( \alpha = \beta \) but only one of the three
(iii) translation: \( \alpha \leq \beta \Rightarrow \alpha + r_\varepsilon \gamma \leq \beta + r_\varepsilon \gamma. \)

**2.2. The Wattenberg Embeding \( \mathbb{R} \) into \( \mathbb{R}_d \)**

**Definition 2.3.** [6]. Wattenberg hyperreal or \#-hyperreal is a nonempty subset \( \alpha \subset \mathbb{R} \) such that:
1. For every \( a \in \alpha \) and \( b \in \alpha \), \( a, b \leq a, b < a \).
(ii) \( \alpha \neq \emptyset, \alpha \neq *\mathbb{R} \).

(iii) \( \alpha \) has no greatest element.

**Definition 2.4.** [6]. In paper [6] Wattenberg embed \( \mathbb{R} \) into \( \mathbb{R}_d \) by following way:

If \( \alpha \in \mathbb{R} \) the corresponding element, \( \alpha^\sharp \), of \( \mathbb{R}_d \) is

\[
\alpha^\sharp = \{ x \in \mathbb{R} \mid x < \alpha \} \tag{2.1}
\]

**Remark 2.3.** [6]. In paper [6] Wattenberg pointed out that condition (iii) above is included only to avoid nonuniqueness. Without it \( \alpha^\sharp \) would be represented by both \( \alpha^\sharp \) and \( \alpha \cup \{ \alpha \} \).

**Remark 2.4.** [7]. However in paper [7] H. Gonshor pointed out that the definition (2.1) in Wattenberg paper [6] is technically incorrect. Note that Wattenberg [6] defines \( -\alpha \) in general by

\[
-\alpha = \{ a \in \mathbb{R} \mid -a \notin \alpha \} \tag{2.2}
\]

If \( \alpha \in \mathbb{R}_d \) i.e. \( \mathbb{R}_d \setminus \alpha \) has no minimum, then there is no any problem with definitions (2.1) and (2.2). However if \( \alpha = a^\# \) for some \( a \in \mathbb{R} \), i.e. \( \alpha^\# = \{ x \in \mathbb{R} \mid x < a \} \) then according to the latter definition (2.2)

\[
\alpha^\# = \{ x \in \mathbb{R} \mid x < a \} \tag{2.3}
\]

whereas the definition of \( \mathbb{R}_d \) requires that:

\[
-\alpha^\# = \{ x \in \mathbb{R} \mid x < -a \} \tag{2.4}
\]

but this is a contradiction.

**Remark 2.5.** Note that in the usual treatment of Dedekind cuts for the ordinary real numbers both of the latter sets are regarded as equivalent so that no serious problem arises [7].

**Remark 2.6.** H. Gonshor [7] defines \( -\alpha^\# \) by

\[
-\alpha^\# = \{ x \in \mathbb{R} \mid \exists b \mid b > a \land -b \notin \alpha \} \tag{2.5}
\]

**Definition 2.5.** (Wattenberg embedding) We embed \( \mathbb{R} \) into \( \mathbb{R}_d \) of the following way: (i) if \( \alpha \in \mathbb{R} \), the corresponding element \( \alpha^\flat \) of \( \mathbb{R}_d \) is

\[
\alpha^\flat = \{ x \in \mathbb{R} \mid x \leq_\mathbb{R} \alpha \} \tag{2.6}
\]

and

\[
-\alpha^\flat = \{ a \in \mathbb{R} \mid -a \notin \alpha \} \cup \{ \alpha \} \tag{2.7}
\]

or in the equivalent way, i.e. if \( \alpha \in \mathbb{R} \) the corresponding element \( \alpha_x \) of \( \mathbb{R}_d \) is

\[
\alpha_x = \{ x \in \mathbb{R} \mid x \geq_\mathbb{R} \alpha \} \tag{2.8}
\]

Thus if \( \alpha \in \mathbb{R} \) then \( \alpha^\flat \triangleq A \cup B \) where

\[
A = \{ x \in \mathbb{R} \mid x \leq_\mathbb{R} \alpha \}, B = \{ y \in \mathbb{R} \mid y \geq_\mathbb{R} \alpha \}. \tag{2.9}
\]

Such embedding \( \mathbb{R} \) into \( \mathbb{R}_d \) Such embedding we will name Wattenberg embedding and to designate by \( \mathbb{R} \longrightarrow \cdash \mathbb{R}_d \).

**Lemma 2.1.** [6].

(i) Addition \( \circ +_d \) is commutative and associative in \( \mathbb{R}_d \).

(ii) \( \forall \alpha \in \mathbb{R}_d : \alpha +_d 0 = \alpha \).

(iii) \( \forall \alpha, \beta \in \mathbb{R} : \alpha^\flat +_d \beta^\flat = (\alpha +_\mathbb{R} \beta)^\flat \).

**Remark 2.7.** Notice, here again something is lost going from \( \mathbb{R} \) to \( \mathbb{R}_d \) since \( a < \beta \) does not imply \( \alpha + \alpha < \beta + \alpha \) since \( 0 < e_d \) but \( 0 + e_d = e_d + e_d = e_d \).
Lemma 2.2. [6].

(i) \( \leq_{\mathbb{R}_d} \) a linear ordering on \( \mathbb{R}_d \) often denoted \( \leq \), which extends the usual ordering on \( \mathbb{R} \).

(ii) \( \alpha \leq_{\mathbb{R}_d} \alpha' \land \beta \leq_{\mathbb{R}_d} \beta' \Rightarrow \alpha +_{\mathbb{R}_d} \beta \leq_{\mathbb{R}_d} \alpha' +_{\mathbb{R}_d} \beta' \).

(iii) \( \alpha <_{\mathbb{R}_d} \alpha' \land \beta <_{\mathbb{R}_d} \beta' \Rightarrow \alpha +_{\mathbb{R}_d} \beta <_{\mathbb{R}_d} \alpha' +_{\mathbb{R}_d} \beta' \).

(iv) \( \mathbb{R} \) is dense in \( \mathbb{R}_d \). That is if \( \alpha <_{\mathbb{R}_d} \beta \) in \( \mathbb{R}_d \) there is an \( \alpha \in \mathbb{R} \) then \( \alpha <_{\mathbb{R}_d} \alpha' <_{\mathbb{R}_d} \beta \).

(v) Suppose that \( A \subseteq \mathbb{R}_d \) is bounded above then \( \sup A = \sup_{a \in A} \alpha = \bigcup_{a \in A} \text{cut}_- (\alpha) \) exist in \( \mathbb{R}_d \).

(vi) Suppose that \( A \subseteq \mathbb{R}_d \) is bounded below then \( \inf A = \inf_{a \in A} \alpha = \bigcup_{a \in A} \text{cut}_+ (\alpha) \) exist in \( \mathbb{R}_d \).

Remark 2.8. Note that in general case \( \inf A = \inf_{a \in A} \alpha \neq \bigcap_{a \in A} \text{cut}_- (\alpha) \). In particular the formula for \( \inf A \) given in [6] on the top of page 229 is not quite correct [7]. However by Lemma 2.2 (vi) this is no problem.

Example 2.2. [7]. The formula \( \inf A = \inf_{a \in A} = \bigcap_{a \in A} \text{cut}_- (\alpha) \) says

\[
\inf_{a \in A} = \left\{ a \left| \exists d > 0 \left[ a + d \in \bigcap_{a \in A} \text{cut}_- (\alpha) \right] \right. \right\}
\]

Let \( A \) be the set \( A = \{ a + d \} \) where \( d \) runs through the set of all positive numbers in \( \mathbb{R} \), then \( \inf A = a = \{ x | x < a \} \). However \( \bigcap_{a \in A} \text{cut}_- (\alpha) = \{ x | x \leq a \} \).

Lemma 2.3. [6].

(i) If \( \alpha \in \mathbb{R} \) then \( -_{\mathbb{R}_d} (\alpha^\circ) = (\mathbb{R}_d)^\circ \).

(ii) \( -_{\mathbb{R}_d} (\mathbb{R}_d) = \alpha \).

(iii) \( \alpha \leq_{\mathbb{R}_d} \beta \Leftrightarrow -_{\mathbb{R}_d} \beta \leq_{\mathbb{R}_d} -_{\mathbb{R}_d} \alpha \).

(iv) \( -_{\mathbb{R}_d} \alpha +_{\mathbb{R}_d} \left( -_{\mathbb{R}_d} \beta \right) \leq_{\mathbb{R}_d} -_{\mathbb{R}_d} \left( \alpha +_{\mathbb{R}_d} \beta \right) \).

(v) \( \forall a \in \mathbb{R} : -_{\mathbb{R}_d} \left( -_{\mathbb{R}_d} a \right) +_{\mathbb{R}_d} \left( -_{\mathbb{R}_d} \beta \right) = -_{\mathbb{R}_d} \left( a^\circ +_{\mathbb{R}_d} \beta \right) \).

(vi) \( \alpha +_{\mathbb{R}_d} \left( -_{\mathbb{R}_d} \alpha \right) \leq_{\mathbb{R}_d} 0_{\mathbb{R}_d} \).

Proof. (v) By (iv): \( (a^\circ)^\circ = (-a) \leq (a^\circ + \beta) \).

1. Suppose now \( c \in (a^\circ + \beta) \) this means \( c < c_1 \in (a^\circ + \beta) \) and therefore

2. \( \exists c_1 \left[ c < c_1 < (a^\circ + \beta) \right] \) and therefore

3. \( -c_1 \in (a^\circ + \beta) \).

4. Note that: \( -c - a \in \beta \) (since \( -c - a \in \beta \) and \( a - (c - c_1) \in a^\circ \) imply \( c_1 = a - (c - c_1) + (c - a) \in a^\circ + \beta \) but this is a contradiction)

5. Thus \( -c - a \in \beta \) and therefore \( c + a \in -\beta \).

6. By similar reasoning one obtains: \( c_1 + a \in -\beta \).

7. Note that: \( -a \in (c_1 - c) \in a^\circ \) and therefore

\[
c = -a - (c_1 - c) + (c_1 + a) \in (-a)^\circ + (-\beta) \]
Lemma 2.4. (i) \( \forall a \in \mathbb{R}, \forall \beta \in \mathbb{R}_d, \mu \in \mathbb{R}, \mu \geq 0 : (-\mu a)^\gamma + (-\mu^\gamma \beta) = -\mu^\gamma (a^\gamma + \beta). \)

(ii) \( \forall a \in \mathbb{R}, \forall \beta \in \mathbb{R}_d, \mu \in \mathbb{R}, \mu \geq 0 : (\mu a)^\gamma + \mu^\gamma \beta = \mu^\gamma (a^\gamma + \beta). \)

Proof. (i) For \( \mu = 0 \) the statement is clear. Suppose now without loss of generality \( \mu > 0 \). By Lemma 2.3. (iv): \((\mu a)^\gamma + (-\mu^\gamma \beta) \leq (-\mu^\gamma a^\gamma + \mu^\gamma \beta). \)

1. Suppose \( c \in -\mu^\gamma (a^\gamma + \beta) \) and therefore \( \frac{c}{\mu} \in -(a^\gamma + \beta) \), but this means

2. \( \exists c_1: \frac{c}{\mu} < \frac{c_1}{\mu} \in -(a^\gamma + \beta) \) and therefore

3. \( -\frac{c_1}{\mu} \notin (a^\gamma + \beta). \)

4. Note that: \( -\frac{c}{\mu} - a \notin \beta \) (since \( -\frac{c}{\mu} - a \in \beta \) and \( a - \left( \frac{c}{\mu} - \frac{c_1}{\mu} \right) \in a^\gamma \) imply

\[ -\frac{c_1}{\mu} = a - \left( \frac{c}{\mu} - \frac{c_1}{\mu} \right) + \left( -\frac{c}{\mu} - a \right) \in a^\gamma + \beta \] but this is a contradiction.

5. Thus \( -\frac{c}{\mu} - a \notin \beta \) and therefore \( c + \mu a \in -\mu^\gamma \beta. \)

6. By similar reasoning one obtains: \( c_1 + \mu a \in -\mu^\gamma \beta. \)

7. Note that: \( -\mu a - (c_1 - c) \in \mu^\gamma a^\gamma \) and therefore

\[ c = -\mu a - (c_1 - c) + (c_1 + \mu a) \in (-\mu^\gamma a^\gamma) + (-\mu^\gamma \beta). \]

(ii) Immediately follows from (i) by Lemma 2.3.

Definition 2.6. Suppose \( \alpha \in \mathbb{R}_d \). The absolute value of \( \alpha \) written \( |\alpha| \) is defined as follows:

\[ |\alpha| = \begin{cases} \alpha & \text{if } \alpha \geq 0 \text{ in } \mathbb{R}_d \\ -\alpha & \text{if } \alpha \leq 0 \text{ in } \mathbb{R}_d \end{cases} \]

Definition 2.7. Suppose \( \alpha, \beta \in \mathbb{R}_d \). The product \( \alpha \times \beta \), is defined as follows: Case (1) \( \alpha, \beta \in \mathbb{R}_d \):

\[ \alpha \times \beta = \left\{ \begin{array}{ll} a \times b \left( 0, a^\gamma, \alpha \right) & \text{if } \alpha \geq 0 \text{ in } \mathbb{R}_d \\ -a \times b \left( 0, a^\gamma, \alpha \right) & \text{if } \alpha < 0 \text{ in } \mathbb{R}_d \end{array} \right. \] (2.10)

Case (2) \( \alpha \in \mathbb{R}_d \), \( \beta = 0 \in \mathbb{R}_d \):

\[ \alpha \times 0 = 0 \times \beta = 0 \times \beta \in \mathbb{R}_d. \]

Case (3) \( \left( \alpha < \mathbb{R}_d, 0 \in \mathbb{R}_d \right) \vee \left( \beta < \mathbb{R}_d, 0 \in \mathbb{R}_d \right) \): \( \alpha \times \beta \in \mathbb{R}_d \):

\[ \alpha \times \beta = \begin{cases} a \times b & \text{if } \alpha \geq \beta \text{ in } \mathbb{R}_d \\ -a \times b & \text{if } \alpha < \beta \text{ in } \mathbb{R}_d \end{cases} \] (2.11)

Lemma 2.5. [6]. (i) \( \forall a, b \in \mathbb{R}: (a \times b)^\gamma = a^\gamma \times b^\gamma. \)

(ii) Multiplication \( \times \) is associative and commutative:

\[ (\alpha \times \beta)^\gamma = \alpha \times (\beta \times \gamma), \quad \alpha \times \beta = \beta \times \alpha. \] (2.12)

(iii) \( 1 \times \alpha = \alpha; \quad -1 \times \alpha = -\alpha, \) where \( 1 \in \mathbb{R}_d = \left( 1 \right) \).
Lemma 2.6. Suppose \( \mu \in \mathbb{R} \) and \( \beta, \gamma \in \mathbb{R}_d \). Then
\[
\left( (\mu^2 \geq 0) \land (\beta \geq 0) \right) \Rightarrow \mu \times_{\mathbb{R}_d} \left( \beta -_{\mathbb{R}_d} \gamma \right) = \mu^2 \times_{\mathbb{R}_d} \beta -_{\mathbb{R}_d} \mu \times_{\mathbb{R}_d} \gamma.
\] (2.15)

Proof. We choose now:

(1) \( a \in \mathbb{R} \) such that: \( -\gamma + a^2 > 0 \).
(2) Note that \( \mu^2 \times (\beta - \gamma) = \mu^2 \times (\beta - \gamma) + \mu^2 \times a^2 - \mu^2 \times a^2 \).
Then from (2) by Lemma 2.4. (ii) one obtains
(3) \( \mu^2 \times (\beta - \gamma) = \mu^2 \times \left( (\beta - \gamma) + \alpha^2 \right) - \mu^2 \times \alpha^2 \). Therefore
(4) \( \mu^2 \times (\beta - \gamma) = \mu^2 \times \beta + \mu^2 \times \alpha^2 - \mu^2 \times a^2 \).
(5) Then from (4) by Lemma 2.5. (v) one obtains
(6) \( \mu^2 \times (\beta - \gamma) = \mu^2 \times \beta + \mu^2 \times a^2 - \mu^2 \times a^2 \).
Then from (6) by Lemma 2.4. (ii) one obtains
(7) \( \mu^2 \times (\beta - \gamma) = \mu^2 \times \beta + \mu^2 \times a^2 - \mu^2 \times a^2 - \mu^2 \times a^2 = \mu^2 \times \beta - \mu^2 \times a^2 \).

Definition 2.8. Suppose \( \alpha \in \mathbb{R}_d \) \( 0 <_{\mathbb{R}_d} \alpha \) then \( \alpha^{-1}_{\mathbb{R}_d} \) is defined as follows:

(i) \( 0_{\mathbb{R}_d} <_{\mathbb{R}_d} \alpha : \alpha^{-1}_{\mathbb{R}_d} \triangleq \inf \left\{ \frac{1}{\alpha} \mid \alpha \in \alpha \right\}, \)
(ii) \( a <_{\mathbb{R}_d} \alpha : \alpha^{-1}_{\mathbb{R}_d} \triangleq \frac{1}{\alpha} \left( \frac{1}{\alpha} \right) \).

Lemma 2.7. [6].

(i) \( \forall a \in \mathbb{R} : \left( a^2 \right)^{-1}_{\mathbb{R}_d} = \left( \frac{1}{a} \right)^2 \).
(ii) \( \left( \alpha^{-1}_{\mathbb{R}_d} \right)^{-1}_{\mathbb{R}_d} = \alpha. \)
(iii) \( 0_{\mathbb{R}_d} <_{\mathbb{R}_d} \alpha \leq_{\mathbb{R}_d} \beta \Rightarrow \beta^{-1}_{\mathbb{R}_d} \leq_{\mathbb{R}_d} \alpha^{-1}_{\mathbb{R}_d}. \)
(iv) \( \left( 0_{\mathbb{R}_d} <_{\mathbb{R}_d} \alpha \right) \lor \left( 0_{\mathbb{R}_d} <_{\mathbb{R}_d} \beta \right) \]
\[
\Rightarrow \left( \alpha^{-1}_{\mathbb{R}_d} \times_{\mathbb{R}_d} \left( \beta^{-1}_{\mathbb{R}_d} \right) \right) \leq_{\mathbb{R}_d} \left( \alpha \times_{\mathbb{R}_d} \beta \right)^{-1}_{\mathbb{R}_d} \)
(v) \( \forall a \in \mathbb{R} : a \neq_{\mathbb{R}_d} 0 \Rightarrow \left( a^2 \right)^{-1}_{\mathbb{R}_d} \times_{\mathbb{R}_d} \left( \beta^{-1}_{\mathbb{R}_d} \right) = \left( a^2 \times_{\mathbb{R}_d} \beta \right)^{-1}_{\mathbb{R}_d}. \)
(vi) \( \alpha \times_{\mathbb{R}_d} \alpha^{-1}_{\mathbb{R}_d} \leq_{\mathbb{R}_d} 1_{\mathbb{R}_d}. \)

Lemma 2.8. [6]. Suppose that \( a \in \mathbb{R} \), \( a > 0, \beta, \gamma \in \mathbb{R}_d \), \( \beta > 0, \gamma > 0. \) Then
\[
\alpha^2 \times_{\mathbb{R}_d} \left( \beta +_{\mathbb{R}_d} \gamma \right) = \alpha^2 \times_{\mathbb{R}_d} \beta +_{\mathbb{R}_d} \alpha \times_{\mathbb{R}_d} \gamma.
\]

Theorem 2.1. Suppose that \( S \) is a non-empty subset of \( \mathbb{R}_d \) which bounded from above, i.e. \( \sup(S) \) exist and suppose that \( \xi \in \mathbb{R}, \xi > 0. \) Then
Since \[ \xi^y \times x \leq \xi^y \times B \quad \text{for any } x \in S. \] Hence \[ T = \{ \xi^y \times x \mid x \in S \} \] is bounded above by \[ \xi^y \times B. \] Hence \[ T \] has a supremum \[ C_T = \sup T. \] Now we have to prove that \[ C_T = \xi^y \times B = \xi^y \times (\sup S). \] Since \[ \xi^y \times B = \xi^y \times (\sup S) \] is an upper bound for \[ T \] and \[ C \] is the smallest upper bound for \[ T, \] \[ C_T \leq \xi^y \times B. \] Now we repeat the argument above with the roles of \[ S \] and \[ T \] reversed. We know that \[ C_T \] is the smallest number such that, for any \[ y \in T, y \leq C_T. \] Since \[ \xi^y > 0 \] it follows that \[ (\xi^y)^{-1} \times y \leq (\xi^y)^{-1} \times C_T \] for any \[ y \in T. \] But \[ S = \{(\xi^y)^{-1} \times y \mid y \in T\}. \] Hence \[ (\xi^y)^{-1} \times C_T \] is an upper bound for \[ S. \] But \[ B \] is a supremum for \[ S. \] Hence \[ B \leq (\xi^y)^{-1} \times C_T \text{ and } \xi^y \times B \leq C_T. \] We have shown that \[ C_T \leq \xi^y \times B \text{ and also that } \xi^y \times B \leq C_T. \] Thus \[ \xi^y \times B = C_T. \]

2.3. Absorption Numbers in \( ^*\mathbb{R}_d \)

One of standard ways of defining the completion of \( ^*\mathbb{R} \) involves restricting oneself to subsets, which have the following property \( \forall e, e > 0 \exists x_{<e}, \exists y_{<e} \forall y - x < e \). It is well known that in this case we obtain a field. In fact the proof is essentially the same as the one used in the case of ordinary Dedekind cuts in the development of the standard real numbers, \( ^*\mathbb{R} \), of course, does not have the above property because no infinitesimal works. This suggests the introduction of the concept of absorption part \( ab.p.(\alpha) \) of a number \( \alpha \) for an element \( \alpha \) of \( ^*\mathbb{R}_d \) which, roughly speaking, measures how much \( \alpha \) departs from having the above property [7].

**Definition 2.9.** [7] Suppose \( \alpha \in ^*\mathbb{R}_d \), then
\[
ab.p.(\alpha) \triangleq \{ d \geq 0 \mid \forall x_{<e} [x + d \in \alpha] \}. \tag{2.17}
\]

**Example 2.5.**

(i) \( \forall \alpha \in ^*\mathbb{R} : ab.p.(\alpha^e) = 0, \)

(ii) \( ab.p.(\varepsilon_d) = \varepsilon_d, \)

(iii) \( ab.p.(-\varepsilon_d) = \varepsilon_d, \)

(iv) \( \forall \alpha \in ^*\mathbb{R} : ab.p.(\alpha^e + \varepsilon_d) = \varepsilon_d. \)

(v) \( \forall \alpha \in ^*\mathbb{R} : ab.p.(\alpha^e - \varepsilon_d) = \varepsilon_d. \)

**Lemma 2.9.** [7].

(i) \( c < ab.p.(\alpha) \) and \( 0 \leq d < c \Rightarrow d \in ab.p.(\alpha) \)

(ii) \( c \in ab.p.(\alpha) \) and \( d \in ab.p.(\alpha) \Rightarrow c + d \in ab.p.(\alpha). \)

**Remark 2.9.** By Lemma 2.7 \( ab.p.(\alpha) \) may be regarded as an element of \( ^*\mathbb{R}_d \) by adding on all negative elements of \( ^*\mathbb{R}_d \) to \( ab.p.(\alpha) \). Of course if the condition \( d \geq 0 \) in the definition of \( ab.p.(\alpha) \) is deleted we automatically get all the negative elements to be in \( ab.p.(\alpha) \) since \( x < y \in \alpha \Rightarrow x \in \alpha \). The reason for our definition is that the real interest lies in the non-negative numbers. A technicality occurs if \( ab.p.(\alpha) = \{0\} \). We then identify \( ab.p.(\alpha) \) with 0. \( \{ ab.p.(\alpha) \} \) becomes \( \{x \mid x < 0\} \) which by our early convention is not in \( ^*\mathbb{R}_d \).

**Remark 2.10.** By Lemma 2.7(ii), \( ab.p.(\alpha) \) is additive idempotent.

**Lemma 2.10.** [7].

(i) \( ab.p.(\alpha) \) is the maximum element \( \beta \in ^*\mathbb{R}_d \) such that \( \alpha + \beta = \alpha. \)

(ii) \( ab.p.(\alpha) \leq \alpha \) for \( \alpha > 0. \)

(iii) If \( \alpha \) is positive and idempotent then \( ab.p.(\alpha) = \alpha. \)

**Lemma 2.11.** [7]. Let \( \alpha \in ^*\mathbb{R}_d \) satisfy \( \alpha > 0. \) Then the following are equivalent. In what follows assume \( a,b > 0. \)
(i) $\alpha$ is idempotent,
(ii) $a, b \in \alpha \Rightarrow a + b \in \alpha$,
(iii) $a \in \alpha \Rightarrow 2a \in \alpha$,
(iv) $\forall n \in \mathbb{N}, [a \in \alpha \Rightarrow n \cdot a \in \alpha]$
(v) $a \in \alpha \Rightarrow r \cdot a \in \alpha$, for all finite $r \in \mathbb{R}$.

Theorem 2.2. [7]. $(-\alpha)+\alpha = -[\text{ab.p.}(\alpha)]$.

Theorem 2.3. [7]. $\text{ab.p.}(\alpha + \beta) \geq \text{ab.p.}(\alpha)$.

Theorem 2.4. [7].

(i) $\alpha + \beta \leq \alpha + \gamma \Rightarrow -\text{ab.p.}(\alpha) + \beta \leq \gamma$.
(ii) $\alpha + \beta = \alpha + \gamma \Rightarrow -[\text{ab.p.}(\alpha)] + \beta = -[\text{ab.p.}(\alpha)] + \gamma$.

Theorem 2.5. [7]. Suppose $\alpha, \beta \in \mathbb{R}_d$, then

(i) $\text{ab.p.}(\alpha) = \text{ab.p.}(\alpha)$,
(ii) $\text{ab.p.}(\alpha + \beta) = \max \{\text{ab.p.}(\alpha), \text{ab.p.}(\beta)\}$

Theorem 2.6. [7]. Assume $\beta > 0$. If $\alpha$ absorbs $-\beta$ then $\alpha$ absorbs $\beta$.

Theorem 2.7. [7]. Let $0 < \alpha \in \mathbb{R}_d$. Then the following are equivalent

(i) $\alpha$ is an idempotent,
(ii) $(-\alpha) + (-\alpha) = -\alpha$,
(iii) $(-\alpha) + \alpha = -\alpha$.
(iv) Let $\Delta_1$ and $\Delta_2$ be two positive idempotents such that $\Delta_2 > \Delta_1$. Then $\Delta_2 + (-\Delta_1) = \Delta_2$.

2.4. Gonshor Types of $\alpha$ with Given ab.p.$(\alpha)$.

Among elements of $\alpha \in \mathbb{R}_d$ such that $\text{ab.p.}(\alpha) = \Delta$ one can distinguish two many different types following [7].

**Definition 2.10.** Assume $\Delta > 0$.

(i) $\alpha \in \mathbb{R}_d$ has type 1 if $\exists x (x \in \alpha) \forall y [x + y \in \alpha \Rightarrow y \in \Delta]$.
(ii) $\alpha \in \mathbb{R}_d$ has type 2 if $\forall x (x \in \alpha) \exists y (y \in \Delta) [x + y \in \alpha]$, i.e. $\alpha \in \mathbb{R}_d$ has type 2 iff $\alpha$ does not have type 1.
(iii) $\alpha \in \mathbb{R}_d$ has type 1A if $\exists x (x \in \alpha) \forall y (y \in \Delta) [x + y \in \alpha]$, $\alpha \in \mathbb{R}_d$ has type 2A if $\forall x (x \notin \alpha) \exists y (y \notin \alpha) [x - y \notin \alpha]$.

2.5. Robinson Part $\mathbb{R}_p(\alpha)$ of Absorption Number $\alpha \in (-\Delta_d, \Delta_d)$

**Theorem 2.8.** [6]. Suppose $\alpha \in (-\Delta_d, \Delta_d)$. Then there is a unique standard $x \in \mathbb{R}$, called Wattenberg standard part of $\alpha$ and denoted by $\text{Wst}(\alpha)$, such that:

(i) $(x)^d = \lbrack \alpha - \varepsilon_d, \alpha + \varepsilon_d \rbrack$,
(ii) $\alpha \leq_{\mathbb{R}_d} \beta$ implies $\text{Wst}(\alpha) \leq \text{Wst}(\beta)$.
(iii) The map $\text{Wst}(\cdot) : \mathbb{R}_d \rightarrow \mathbb{R}$ is continuous.
(iv) $\text{Wst}(\alpha + \beta) = \text{Wst}(\alpha) + \text{Wst}(\beta)$.
(v) $\text{Wst}(\alpha \times \beta) = \text{Wst}(\alpha) \times \text{Wst}(\beta)$.
(vi) $\text{Wst}(\alpha^{-1}) = -\text{Wst}(\alpha)$.
(vii) $\text{Wst}(\alpha^{-1}) = \lbrack \text{Wst}(\alpha) \rbrack^{-1}$ if $\alpha \notin [-\varepsilon_d, \varepsilon_d]$.

**Theorem 2.9.** [7].
(i) \( \alpha \in \mathbb{^+R}_d \) has type 1 iff \(-\alpha \) has type 1A.

(ii) \( \alpha \in \mathbb{^+R}_d \) cannot have type 1 and type 1A simultaneously.

(iii) Suppose \( \text{ab.p.}(\alpha) = \Delta > 0 \). Then \( \alpha \) has type 1 iff \( \alpha \) has the form \( a^\varepsilon + \Delta \) for some \( a \in \mathbb{^+R} \).

(iv) Suppose \( \text{ab.p.}(\alpha) = -\Delta, \Delta > 0 \). \( \alpha \in \mathbb{^+R}_d \) has type 1A iff \( \alpha \) has the form \( a^\varepsilon + (-\Delta) \) for some \( a \in \mathbb{^+R} \).

(v) If \( \text{ab.p.}(\alpha) > \text{ab.p.}(\beta) \) then \( \alpha + \beta \) has type 1 iff \( \alpha \) has type 1.

(vi) If \( \text{ab.p.}(\alpha) = \text{ab.p.}(\beta) \) then \( \alpha + \beta \) has type 2 iff either \( \alpha \) or \( \beta \) has type 2.

**Proof** (iii) Let \( \alpha = a + \Delta \). Then \( \text{ab.p.}(\alpha) = \Delta \). Since \( \Delta > 0, a \in a + \Delta \) (we chose \( d \in \Delta \) such that \( 0 < d \) and write \( a \) as \( (a - d) + d \)).

It is clear that \( a \) works to show that \( \alpha \) has type 1.

Conversely, suppose \( \alpha \) has type 1 and choose \( a \in \mathbb{^+R} \) such that:

\[
\forall \epsilon \in [0, \Delta) : \forall \alpha \in \mathbb{^+R}_d \implies \epsilon \in \alpha
\]

Then we claim that:

\[
\alpha = a + \Delta
\]

By definition of \( \text{ab.p.}(\alpha) \) certainly \( a + \Delta \leq \alpha \). On the other hand by choice of \( a \), every element of \( \alpha \) has the form \( d \in \Delta \).

Choose \( d' \in \Delta \) such that \( d' > d \), then \( a + d = [a - (d' - d)] + d' \in a + \Delta \).

Hence \( a \leq a + \Delta \). Therefore \( \alpha = a + \Delta \).

**Examples.**

(i) \( \varepsilon \in \mathbb{^+R}_d \) has type 1 and therefore \( -\varepsilon \in \mathbb{^+R}_d \) has type 1A. Note that also \( -\varepsilon \) has type 2.

(ii) Suppose \( \varepsilon = 0, \varepsilon \in \mathbb{^+R}_d \) then \( \varepsilon^\varepsilon \times \varepsilon \) has type 1 and therefore \( \varepsilon^\varepsilon \times \varepsilon \) has type 1A.

(iii) Suppose \( \alpha = a + \Delta \). Then \( \alpha - \Delta \) also has type 1 by Theorem 2.9 \( \alpha \) has the form \( a^\varepsilon + \Delta \) for some unique \( \alpha \in \mathbb{^+R}_d \).

(iv) Suppose \( \alpha = -a + \Delta \) and \( \alpha \) has type 1A, i.e. \( \alpha \) has the form \( a^\varepsilon + \Delta \) for some \( a \in \mathbb{^+R} \). Then, we define Robinson part \( \mathfrak{R}[\alpha] \) of absorption number \( \alpha \) by formula

\[
\mathfrak{R}[\alpha] = \{a^\varepsilon\}
\]

Remark 2.11. Note that in general case, i.e. if \( \alpha \in (-\Delta, \Delta) \) then \( \mathfrak{R}[\alpha] \) is not unique.

Remark 2.12. Suppose \( \alpha \in \mathbb{^+R}_d \) and \( \alpha \in (-\Delta, \Delta) \) has type 1 or type 1A. Then by definitions above one obtains the representation...
\[ \alpha = \mathfrak{N} \{ \alpha \} + \mathfrak{ab.p}(\alpha) . \]

2.6. The Pseudo-Ring of Wattenberg Hyperintegers \( ^*_Z_d \)

Lemma 2.12. \([6]\). Suppose that \( \alpha \in ^*_R_d \). Then the following two conditions on \( \alpha \) are equivalent:

(i) \( \alpha = \sup \left\{ v^x \mid (v \in ^*_Z) \land (v^x \leq \alpha) \right\} \),
(ii) \( \alpha = \inf \left\{ v^x \mid (v \in ^*_Z) \land (\alpha \leq v^x) \right\} \).

Definition 2.11. \([6]\). If \( \alpha \) satisfies the conditions mentioned above \( \alpha \) is said to be the Wattenberg hyperinteger. The set of all Wattenberg hyperintegers is denoted by \( ^*_Z_d \).

Lemma 2.13. \([6]\). Suppose \( \alpha, \beta \in ^*_Z_d \). Then

(i) \( \alpha + \beta \in ^*_Z_d \),
(ii) \( -\alpha \in ^*_Z_d \),
(iii) \( \alpha \times \beta \in ^*_Z_d \).

The set of all positive Wattenberg hyperintegers is called the Wattenberg hypernaturals and is denoted by \( ^*_N_d \).

Definition 2.12. Suppose that (i) \( \lambda \in ^*_N, \nu \in ^*_Z_d \), (ii) \( \hat{\lambda} = \lambda^x, \hat{\nu} = \nu^x \) and (iii) \( \lambda \mid \nu \).

If \( \hat{\lambda} \in ^*_N_d \) and \( \hat{\nu} \in ^*_Z_d \) satisfies these conditions then we say that \( \hat{\nu} \) is divisible by \( \hat{\lambda} \) and we denote this by \( \hat{\lambda} \mid \hat{\nu} \).

Definition 2.13. Suppose that (i) \( \alpha \in ^*_Z_d \) and (ii) there exists \( \lambda^x \in ^*_N_d \) such that

1. \( \alpha = \sup \left\{ v^x \mid (v \in ^*_Z) \land (\lambda^x \mid v) \land (v^x \leq \alpha) \right\} \) or
2. \( \alpha = \inf \left\{ v^x \mid (v \in ^*_Z) \land (\lambda^x \mid v) \land (\alpha \leq v^x) \right\} \).

If \( \alpha \) satisfies the conditions mentioned above then we say that \( \alpha \) is divisible by \( \lambda^x \) and we denote this by \( \lambda^x \mid \alpha \).

Theorem 2.10. (i) Let \( p \in ^*_N, M(p) \in ^*_N \), be a prime hypernaturals such that (i) \( p \mid M(p) \). Let \( \alpha \in ^*_Z_d \) be a Wattenberg hypernatural such that (i) \( p \mid \alpha \). Then \( \left( M(p) \right)^x + \alpha > 1 \).

(ii) \( \alpha \in ^*_Z_d \) has type 1 iff \( -\alpha \) has type 1A,
(iii) \( \alpha \in ^*_Z_d \) cannot have type 1 and type 1A simultaneously.
(iv) Suppose \( \alpha \in ^*_Z_d, \mathfrak{ab.p} \alpha = \Delta > 0 \). Then \( \alpha \) has type 1 iff \( \alpha \) has the form \( a^x + \Delta \) for some \( a \in \alpha, a \in ^*_Z \).
(v) Suppose \( \alpha \in ^*_Z_d, \mathfrak{ab.p} \alpha = -\Delta, \Delta > 0 \). \( \alpha \in ^*_Z_d \) has type 1A iff \( \alpha \) has the form \( a^x + (-\Delta) \) for some \( a \in \alpha, a \in ^*_Z \).

(vi) Suppose \( \alpha \in ^*_Z_d \). If \( \mathfrak{ab.p} \alpha > \mathfrak{ab.p} \beta \) then \( \alpha + \beta \) has type 1 iff \( \alpha \) has type 1.
(vii) Suppose \( \alpha \in ^*_Z_d \). If \( \mathfrak{ab.p} \alpha = \mathfrak{ab.p} \beta \) then \( \alpha + \beta \) has type 2 iff either \( \alpha \) or \( \beta \) has type 2.

Proof. (i) Immediately follows from definitions (2.12)-(2.13).
(iv) Let \( \alpha = a + \Delta \). Then \( \mathfrak{ab.p} \alpha = \Delta \). Since \( \Delta > 0, a \in a + \Delta \) (we chose \( d \in \Delta \) such that \( 0 < d \) and write \( a \) as \( (a - d) + d \)).

It is clear that \( a \) works to show that \( \alpha \) has type 1.

Conversely, suppose \( \alpha \) has type 1 and choose \( a \in \alpha \) such that: \( \forall y \left[ a + y \in \alpha \Rightarrow y \in \Delta \right] \). Then we claim that: \( \alpha = a + \Delta \).

By definition of \( \mathfrak{ab.p} \alpha \) certainly \( a + \Delta \leq \alpha \). On the other hand by choice of \( a \), every element of \( \alpha \) has the form \( a + d \) with \( d \in \Delta \).

Choose \( d' \in \Delta \) such that \( d' > d \), then \( a + d = \left[ a - (d' - d) \right] + d' \in a + \Delta \).
Hence \( \alpha \leq a + \Delta \). Therefore \( \alpha = a + \Delta \).

2.7. The Integer Part \( \text{Int.p}(\alpha) \) of Wattenberg Hyperreals \( \alpha \in \mathbb{R}_d^* \)

**Definition 2.14.** Suppose \( \alpha \in \mathbb{R}_d^*, \alpha \geq 0 \). Then, we define \( \text{Int.p}(\alpha) = [\alpha] \in \mathbb{N}_d^* \) by formula

\[
[\alpha] = \sup \left\{ \nu^* \mid (\nu \in \mathbb{N}) \land (\nu^* \leq \alpha) \right\}.
\]

Obviously there are two possibilities:

1. A set \( \left\{ \nu^* \mid (\nu \in \mathbb{N}) \land (\nu^* \leq \alpha) \right\} \) has no greatest element. In this case valid only the

**Property I:** \( [\alpha] = \alpha \)

Since \( [\alpha] < \alpha \) implies \( \exists \alpha \in \mathbb{R} \) such that \( [\alpha] < a^* < \alpha \). But then \( [a^*] < \alpha \) which implies \( [a^*] + 1 < \alpha \) contradicting \( [\alpha] < a^* < [a^*] + 1 \).

2. A set \( \left\{ \nu^* \mid (\nu \in \mathbb{N}) \land (\nu^* \leq \alpha) \right\} \) has a greatest element, \( \nu \in \mathbb{N} \). In this case valid the

**Property II:** \( [\alpha] = \nu \) and obviously \( \nu = [\alpha] \leq [\alpha] + 1 = \nu + 1 \).

**Definition 2.15.** Suppose \( \alpha \in \mathbb{R}_d^* \). Then, we define \( \text{Int.p}(\alpha) = \mathbb{Z}_d^* \) by formula

\[
\text{Int.p}(\alpha) = \begin{cases} 
[\alpha] & \text{for } \alpha \geq 0 \\
[-[\alpha]] & \text{for } \alpha < 0.
\end{cases}
\]

Note that obviously: \( \text{Int.p}(\alpha) = -\text{Int.p}(\alpha) \).

2.8. External Sum of the Countable Infinite Series in \( \mathbb{R}_d^* \)

This subsection contains key definitions and properties of summ of countable sequence of Wattenberg hyperreals.

**Definition 2.16.**[4] Let \( \{s_n\}_{n=1}^\infty \) be a countable sequence \( s_n : \mathbb{N} \to \mathbb{R} \) such that

(i) \( \forall n (s_n \geq 0) \) or (ii) \( \forall n (s_n < 0) \) or

(iii) \( \{s_n\}_{n=1}^\infty = \{s_n\}_{n \in \mathbb{N}_1} \cup \{s_n\}_{n \in \mathbb{N}_2} \land \forall n_1 (n_1 \in \mathbb{N}_1) [s_{n_1} \geq 0] \land \forall n_2 (n_2 \in \mathbb{N}_2) [s_{n_2} < 0] \land \mathbb{N} = \mathbb{N}_1 \cup \mathbb{N}_2 \).

Then external sum (#-sum) \( \#\text{Ext} \sum_{n \in \mathbb{N}} s_n^* \) of the corresponding countable sequence \( *s_n : \mathbb{N} \to *\mathbb{R} \) is defined by

\[
\begin{align*}
(\text{i}) & & \forall n (s_n \geq 0) : \#\text{Ext} \sum_{n \in \mathbb{N}} s_n^* = \sup \left\{ \sum_{n \in \mathbb{N}} (s_n)^* \right\}, \\
(\text{ii}) & & \forall n (s_n < 0) : \#\text{Ext} \sum_{n \in \mathbb{N}} s_n^* = \inf \left\{ \sum_{n \in \mathbb{N}} (s_n)^* \right\} = -\sup \left\{ \sum_{n \in \mathbb{N}} (|s_n|)^* \right\}, \\
(\text{iii}) & & \forall n_1 (n_1 \in \mathbb{N}_1) [s_{n_1} \geq 0] \land \forall n_2 (n_2 \in \mathbb{N}_2) [s_{n_2} < 0] : \#\text{Ext} \sum_{n \in \mathbb{N}_1} s_n^* + \#\text{Ext} \sum_{n \in \mathbb{N}_2} s_n^*.
\end{align*}
\]

**Theorem 2.11.** (i) Let \( \{s_n\}_{n=1}^\infty \) be a countable sequence \( s_n : \mathbb{N} \to \mathbb{R} \) such that \( \forall n (n \in \mathbb{N}) [s_{n+1} \geq s_n] \) and \( \lim_{n \to \infty} s_n = \eta \). Then \( \sup_{n \in \mathbb{N}} (s_n)^* = (\star \eta)^* - \varepsilon_d \).

(ii) Let \( \{s_n\}_{n=1}^\infty \) be a countable sequence \( s_n : \mathbb{N} \to \mathbb{R} \) such that \( \forall n (n \in \mathbb{N}) [s_{n+1} < s_n] \) and \( \lim_{n \to \infty} s_n = \eta \). Then \( \inf_{n \in \mathbb{N}} (\star s_n)^* = (\star \eta)^* + \varepsilon_d \).
(iii) Let \( \{ s_n \}_{n=1}^\infty \) be a countable sequence \( s_n : \mathbb{N} \to \mathbb{R} \) such that \( \forall n \in \mathbb{N} \) \( [s_n \geq 0] \), \( \sum_{n=1}^\infty s_n = \eta < \infty \) and infinite series \( \sum_{n=1}^\infty s_n \) absolutely converges to \( \eta \) in \( \mathbb{R} \). Then

\[
\#\text{Ext} \sum_{n=1}^\infty s_n^\delta = \sup_{k \in \mathbb{N}} \left( \sum_{n \leq k} (s_n)^\delta \right) = (\eta)^\delta - \varepsilon_d \in \star \mathbb{R}_d,
\]

(2.23)

(iv) Let \( \{ s_n \}_{n=1}^\infty \) be a countable sequence \( s_n : \mathbb{N} \to \mathbb{R} \) such that \( \forall n \in \mathbb{N} \) \( [s_n < 0] \), \( \sum_{n=1}^\infty s_n = \eta > -\infty \) and infinite series \( \sum_{n=1}^\infty s_n \) absolutely converges to \( \eta \) in \( \mathbb{R} \). Then

\[
\#\text{Ext} \sum_{n=1}^\infty s_n^\delta = \inf_{k \in \mathbb{N}} \left( \sum_{n \leq k} (s_n)^\delta \right) = (\eta)^\delta + \varepsilon_d \in \star \mathbb{R}_d.
\]

(2.24)

(v) Let \( \{ s_n \}_{n=1}^\infty \) be a countable sequence \( s_n : \mathbb{N} \to \mathbb{R} \) such that

(1) \( \{ s_n \}_{n=1}^\infty = \{ s_n \}_{n \in \mathbb{N}} \cup \{ s_n \}_{n \geq 2} \), \( \forall n_1 \in \mathbb{N}_1 \), \( \forall n_2 \in \mathbb{N}_2 \), \( [s_{n_1} \geq 0] \), \( \forall n_2 \in \mathbb{N}_2 \), \( [s_{n_2} < 0] \), \( \mathbb{N} = \mathbb{N}_1 \cup \mathbb{N}_2 \) and

(2) \( \sum_{n_1 \in \mathbb{N}_1} s_{n_1} = \eta_1 < \infty \), \( \sum_{n_2 \in \mathbb{N}_2} s_{n_2} = \eta_2 > -\infty \).

Then

\[
\#\text{Ext} \sum_{n_1 \in \mathbb{N}_1} s_{n_1}^\delta \#\text{Ext} \sum_{n_2 \in \mathbb{N}_2} s_{n_2}^\delta = (\eta_1)^\delta + (\eta_2)^\delta - \varepsilon_d \in \star \mathbb{R}_d.
\]

(2.25)

**Proof.** (i) Let \( \forall n \in \mathbb{N} \) \( [s_{n+1} > s_n] \) and \( \lim_{n \to \infty} s_n = \eta \). Then obviously: \( \forall n \in \mathbb{N} \) \( [s_n < \eta] \).

Thus \( \forall \varepsilon \in \mathbb{R} \) there exists \( M \in \mathbb{N} \) such that (1)

(1) \( \forall k \in \mathbb{N} : \eta - \varepsilon < s_{M+k} < \eta \).

Therefore from (1) by Robinson transfer one obtains (2)

(2) \( \forall \varepsilon \in \mathbb{R}, \forall k \in \mathbb{N} : (\eta)^\delta - (\varepsilon)^\delta < (s_{M+k})^\delta < (\eta)^\delta \).

Using now Wattenberg embedding from (2) we obtain (3)

(3) \( \forall \varepsilon \in \mathbb{R}, \forall k \in \mathbb{N} : (\eta)^\delta - (\varepsilon)^\delta < (s_{M+k})^\delta < (\eta)^\delta \).

From (3) one obtains (4)

(4) \( \forall \varepsilon \in \mathbb{R} : (\eta)^\delta - (\varepsilon)^\delta < \sup_{k \in \mathbb{N}} (s_{M+k})^\delta < (\eta)^\delta \).

Note that \( \forall \delta \in \mathbb{R} \) \( (\delta \in \mathbb{R}) \forall (\delta \approx 0) \) \( [\eta] \) obviously

(5) \( \sup_{n \in \mathbb{N}} (s_n^\delta) < (\eta)^\delta - \delta^\delta \).

From (4) and (5) one obtains (6)

(6) \( \forall \varepsilon \in \mathbb{R} \) \( \forall \delta \in \mathbb{R} \) \( \forall (\varepsilon \approx 0) \) \( (\eta)^\delta - (\varepsilon)^\delta < \sup_{n \in \mathbb{N}} (s_n^\delta) < (\eta)^\delta - \delta^\delta \).

Thus (i) immediately from (6) and from definition of the idempotent \( -\varepsilon_d \).

**Proof (ii)** Immediately from (i) by Lemma 2.3 (v).

**Proof (iii)** Let \( \eta_m = \sum_{n=1}^m s_n \). Then obviously: \( \eta_m < \eta \) and \( \lim_{m \to \infty} \eta_m = \eta \). Thus \( \forall \varepsilon \in \mathbb{R} \) there exists \( M \in \mathbb{N} \) such that (1)

(1) \( \forall k \in \mathbb{N} : \eta - \varepsilon < s_{M+k} < \eta \).

Therefore from (1) by Robinson transfer one obtains (2)

(2) \( \forall \varepsilon \in \mathbb{R}, \forall k \in \mathbb{N} : (\eta)^\delta - (\varepsilon)^\delta < (s_{M+k})^\delta < (\eta)^\delta \).

Using now Wattenberg embedding from (2) we obtain (3)

(3) \( \forall \varepsilon \in \mathbb{R}, \forall k \in \mathbb{N} : (\eta)^\delta - (\varepsilon)^\delta < (s_{M+k})^\delta < (\eta)^\delta \).

From (3) one obtains (4)
From (4) by Definition 2.16 (i) one obtains
\[
\forall x \in \mathbb{R} : \left( \eta^x \right) - \left( \epsilon^x \right) < \sup_{k \in \mathbb{N}} \left( \eta^x_{M+k} \right) < \left( \eta^x \right).
\]

Note that \( \forall \delta \left( [\delta \in \mathbb{R}] \cap (\delta \approx 0) \right) \) obviously
\[
\# \text{Ext} \sum_{n=N}^{\infty} \left( \epsilon^x_n \right) < \left( \eta^x \right) - \delta^x.
\]

From (5)-(6) follows (7)
\[
\# \text{Ext} \sum_{n=N}^{\infty} \left( \epsilon^x_n \right) < \left( \eta^x \right) - \delta^x.
\]

Thus Equation (2.23) immediately from (7) and from definition of the idempotent \( -\epsilon_d \).

**Proof.** Immediately from (iii) by Lemma 2.3 (v).

**Proof.** From Definition 2.16 (iii) and Equation (2.23)-Equation (2.24) by Theorem 2.7 (iii) one obtains
\[
\# \text{Ext} \sum_{n=N}^{\infty} \left( \epsilon^x_n \right) < \left( \eta^x \right) - \delta^x.
\]

**Theorem 2.12.** Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \rightarrow \mathbb{R} \) such that \( \forall n \left( a_n \geq 0 \right) \) and infinite series \( \sum_{n=1}^{\infty} a_n \) absolutely converges in \( \mathbb{R} \). Let \( s = \# \text{Ext} \sum_{n=1}^{\infty} a_n \) be external sum of the corresponding countable sequence \( \{a_n\}_{n=1}^{\infty} \). Let \( \{b_n\}_{n=1}^{\infty} \) be a countable sequence where \( b_n = a_{m(n)} \) is any rearrangement of terms of the sequence \( \{a_n\}_{n=1}^{\infty} \). Then external sum \( \sigma = \# \text{Ext} \sum_{n=1}^{\infty} b_n \) of the corresponding countable sequence \( \{b_n\}_{n=1}^{\infty} \) has the same value \( s \) as external sum of the countable sequence \( \{a_n\}_{n=1}^{\infty} \), i.e. \( \sigma = s - \epsilon_d \).

**Theorem 2.13.** (i) Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \rightarrow \mathbb{R} \) such that \( \forall n \left( a_n \geq 0 \right) \), \( \left( \sum_{n=1}^{\infty} a_n \right) \) absolutely converges to \( \eta \neq +\infty \) in \( \mathbb{R} \) and let \( \# \text{Ext} \sum_{n=1}^{\infty} a_n \) be external sum of the corresponding sequence \( \{a_n\}_{n=1}^{\infty} \). Then for any \( c \in \mathbb{R} \), the equality is satisfied
\[
c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = \# \text{Ext} \sum_{n=1}^{\infty} c^x \times a_n = c^x \times \left( \eta^x \right) - c^x \times \epsilon_d.
\]

(ii) Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \rightarrow \mathbb{R} \) such that \( \forall n \left( a_n < 0 \right) \), \( \left( \sum_{n=1}^{\infty} a_n \right) \) absolutely converges to \( \eta \neq -\infty \) in \( \mathbb{R} \) and let \( \# \text{Ext} \sum_{n=1}^{\infty} a_n \) be external sum of the corresponding sequence \( \{a_n\}_{n=1}^{\infty} \). Then for any \( c \in \mathbb{R} \), the equality is satisfied:
\[
c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = \# \text{Ext} \sum_{n=1}^{\infty} c^x \times a_n = c^x \times \left( \eta^x \right) - c^x \times \epsilon_d.
\]

(iii) Let \( \{s_n\}_{n=1}^{\infty} \) be a countable sequence \( s_n : \mathbb{N} \rightarrow \mathbb{R} \) such that
\[
\begin{align*}
1) & \quad \{s_n\}_{n=1}^{\infty} = \left( \{s_n\}_{n=1}^{\infty} \right) \cup \left( \{s_n\}_{n=1}^{\infty} \right) \cap \{s_n \geq 0 \}, \forall n_1 \left( s_{n_1} \in \mathbb{N} \right), \forall n_2 \left( s_{n_2} \in \mathbb{N} \right), \forall s_{n_1} \left( s_{n_1} \geq 0 \right), \forall s_{n_2} \left( s_{n_2} < 0 \right), \quad \mathbb{N} = \mathbb{N}_1 \cup \mathbb{N}_2, \\
2) & \quad \left( \sum_{n=1}^{\infty} a_n \right) \text{ absolutely converges to } \eta \neq +\infty \text{ in } \mathbb{R}, \\
3) & \quad \left( \sum_{n=1}^{\infty} a_n \right) \text{ absolutely converges to } \eta \neq -\infty \text{ in } \mathbb{R}.
\end{align*}
\]
Then the equality is satisfied:
\[
\begin{align*}
c^\varepsilon \times \left( \# \text{Ext} - \sum_{n \in \mathbb{N}} s^\varepsilon_n \right) &= \# \text{Ext} - \sum_{n \in \mathbb{N}} c^\varepsilon \times s^\varepsilon_n + \# \text{Ext} - \sum_{n_2 \in \mathbb{N}_2} c^\varepsilon \times s^\varepsilon_{n_2} \\
&= c^\varepsilon \times \left( \left( \eta_1^\varepsilon \right)^\varepsilon \right) + \left( \left( \eta_2^\varepsilon \right)^\varepsilon \right) - c^\varepsilon \times \varepsilon^\varepsilon_d. \tag{2.28}
\end{align*}
\]

**Proof.** (i) From Definition 2.16. (i) by Theorem 2.1, Theorem 2.11. (i) and Lemma (2.4) (ii) one obtains
\[
\# \text{Ext} - \sum_{n \in \mathbb{N}} c^\varepsilon \times a^\varepsilon_n = c^\varepsilon \times \left( \# \text{Ext} - \sum_{n \in \mathbb{N}} a^\varepsilon_n \right) = c^\varepsilon \times \left( \left( \eta \right)^\varepsilon - \varepsilon^\varepsilon_d \right) = c^\varepsilon \times \left( \left( \eta \right)^\varepsilon \right) - c^\varepsilon \times \varepsilon^\varepsilon_d.
\]

(ii) Straightforward from Definition 2.16. (i) and Theorem 2.1, Theorem 2.11. (ii) and Lemma (2.4) (ii) one obtains
\[
\left( \# \text{Ext} - \sum_{n \in \mathbb{N}} c^\varepsilon \times a^\varepsilon_n \right) = c^\varepsilon \times \left( \left( \eta \right)^\varepsilon \right) + \varepsilon^\varepsilon_d = c^\varepsilon \times \left( \left( \eta \right)^\varepsilon \right) + c^\varepsilon \times \varepsilon^\varepsilon_d.
\]

(iii) By Theorem 2.11. (iii) and Lemma (2.4). (ii) one obtains
\[
c^\varepsilon \times \left( \# \text{Ext} - \sum_{n \in \mathbb{N}} a^\varepsilon_n \right) = c^\varepsilon \times \left( \left( \eta_1^\varepsilon \right)^\varepsilon + \left( \eta_2^\varepsilon \right)^\varepsilon - \varepsilon^\varepsilon_d \right) = c^\varepsilon \times \left( \left( \eta_1^\varepsilon \right)^\varepsilon \right) + c^\varepsilon \times \varepsilon^\varepsilon_d.
\]

But other side from (i) and (ii) follows
\[
\# \text{Ext} - \sum_{n \in \mathbb{N}} c^\varepsilon \times a^\varepsilon_n + \# \text{Ext} - \sum_{n_2 \in \mathbb{N}_2} c^\varepsilon \times s^\varepsilon_{n_2} = c^\varepsilon \times \left( \left( \eta_1^\varepsilon \right)^\varepsilon - c^\varepsilon \times \varepsilon^\varepsilon_d + c^\varepsilon \times \left( \left( \eta \right)^\varepsilon \right) \right) + c^\varepsilon \times \varepsilon^\varepsilon_d = c^\varepsilon \times \left( \left( \eta_1^\varepsilon \right)^\varepsilon \right) + \left( \left( \eta_2^\varepsilon \right)^\varepsilon \right) - c^\varepsilon \times \varepsilon^\varepsilon_d.
\]

**Definition 2.17.** Let \( \{a_n\}_{n=1}^\infty \) be a countable sequence \( a_n : \mathbb{N} \to \mathbb{R} \), such that infinite series \( \sum_{n=1}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \neq \pm \infty \). We assume now that:

(i) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{i=k}^m a_n > \eta \), or

(ii) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{i=m}^k a_n < \eta \), or

(iii) there exists infinite sequence \( n_i, i=1,2,\cdots \) such that

(a) \( \forall i,m : \sum_{n=m}^\infty a_n > \eta \) and infinite series \( \sum_{n=m}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \) and

(b) there exists infinite sequence \( n_j, j=1,2,\cdots \) such that \( \forall j,m : \sum_{j=m}^\infty a_n < \eta \) and infinite series \( \sum_{j=m}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \).

Then: (i) external upper sum (\#-upper sum) of the corresponding countable sequence \( *a_n : \mathbb{N} \to \mathbb{R} \) is defined by
\[
\begin{align*}
(\text{i}) & \quad \# \text{Ext} - \sum_{n \in \mathbb{N}} a^\varepsilon_n \triangleq \inf_{k \in \mathbb{N}} \left\{ \sum_{n \in \mathbb{N}} \left( *a_n \right)^\varepsilon \right\}, \\
(\text{ii}) & \quad \# \text{Ext} - \sum_{n \in \mathbb{N}} a^\varepsilon_{n_k} \triangleq \inf_{k \in \mathbb{N}} \left\{ \sum_{n \in \mathbb{N}} \left( *a_n \right)^\varepsilon \right\}. \tag{2.29}
\end{align*}
\]

(ii) external lower sum (\#-lower sum) of the corresponding countable sequence \( *a_n : \mathbb{N} \to \mathbb{R} \) is defined by
\[
\begin{align*}
(\text{i}) & \quad \# \text{Ext} - \sum_{n \in \mathbb{N}} a^\varepsilon_n \triangleq \sup_{k \in \mathbb{N}} \left\{ \sum_{n \in \mathbb{N}} \left( *a_n \right)^\varepsilon \right\}, \\
(\text{ii}) & \quad \# \text{Ext} - \sum_{n \in \mathbb{N}} a^\varepsilon_{n_k} \triangleq \sup_{k \in \mathbb{N}} \left\{ \sum_{n \in \mathbb{N}} \left( *a_n \right)^\varepsilon \right\}. \tag{2.30}
\end{align*}
\]
Theorem 2.14. (1) Let \( \{a_n\}_{n=1}^\infty \) be a countable sequence \( a_n : \mathbb{N} \to \mathbb{R} \), such that infinite series \( \sum_{n=1}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \neq \pm \infty \). We assume now that:

(i) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{n=1}^k a_n > \eta \), or
(ii) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{n=1}^k a_n < \eta \), or
(iii) there exists infinite sequence \( n_i, i = 1, 2, \ldots \) such that

(a) \( \forall i, m : \sum_{n=1}^m a_n > \eta \) and infinite series \( \sum_{n=1}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \)
(b) there exists infinite sequence \( n_j, j = 1, 2, \ldots \) such that \( \forall j, m : \sum_{n=1}^m a_n < \eta \) and infinite series \( \sum_{n=1}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \).

Then

\[
\begin{align*}
\#\operatorname{Ext}\sum_{n \in \mathbb{N}} a_n^g &\triangleq \inf_{k \in \mathbb{N}} \left\{ \sum_{n \in [1,k]} \left( a_n \right)^g \right\} = \left( \ast \eta \right)^g + \varepsilon_d \in \ast \mathbb{R}_d, \\
\#\operatorname{Ext}\sum_{n \in \mathbb{N}} a_n^g &\triangleq \sup_{k \in \mathbb{N}} \left\{ \sum_{n \in [1,k]} \left( a_n \right)^g \right\} = \left( \ast \eta \right)^g - \varepsilon_d \in \ast \mathbb{R}_d.
\end{align*}
\]

and

\[
\begin{align*}
\#\operatorname{Ext}\sum_{i \in \mathbb{N}} a_{n_i}^g &\triangleq \inf_{k \in \mathbb{N}} \left\{ \sum_{i \in [1,k]} \left( a_{n_i} \right)^g \right\} = \left( \ast \eta \right)^g + \varepsilon_d \in \ast \mathbb{R}_d, \\
\#\operatorname{Ext}\sum_{i \in \mathbb{N}} a_{n_i}^g &\triangleq \sup_{k \in \mathbb{N}} \left\{ \sum_{i \in [1,k]} \left( a_{n_i} \right)^g \right\} = \left( \ast \eta \right)^g - \varepsilon_d \in \ast \mathbb{R}_d.
\end{align*}
\]

Proof. (i), (ii), (iii) straightforward from definitions.

Theorem 2.15. (1) Let \( \{a_n\}_{n=1}^\infty \) be a countable sequence \( a_n : \mathbb{N} \to \mathbb{R} \), such that infinite series \( \sum_{n=1}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \neq \pm \infty \). We assume now that:

(i) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{n=1}^k a_n > \eta \), or
(ii) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{n=1}^k a_n < \eta \), or
(iii) there exists infinite sequence \( n_i, i = 1, 2, \ldots \) such that

(a) \( \forall i, m : \sum_{n=1}^m a_n > \eta \) and infinite series \( \sum_{n=1}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \)
(b) there exists infinite sequence \( n_j, j = 1, 2, \ldots \) such that \( \forall j, m : \sum_{n=1}^m a_n < \eta \) and infinite series \( \sum_{n=1}^\infty a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta \).

Then for any \( c \in \ast \mathbb{R}_d \), the equalities is satisfied

\[
\begin{align*}
\#\operatorname{Ext}\sum_{a \in \mathbb{N}} c^x \times a_n^s = c^x \times \left( \#\operatorname{Ext}\sum_{a \in \mathbb{N}} a_n^s \right) = c^x \times \left( \ast \eta \right)^s + c^x \times \varepsilon_d \in \ast \mathbb{R}_d, \\
\#\operatorname{Ext}\sum_{a \in \mathbb{N}} c^x \times a_n^s = c^x \times \left( \#\operatorname{Ext}\sum_{a \in \mathbb{N}} a_n^s \right) = c^x \times \left( \ast \eta \right)^s - c^x \times \varepsilon_d \in \ast \mathbb{R}_d.
\end{align*}
\]

and

\[
\begin{align*}
\#\operatorname{Ext}\sum_{i \in \mathbb{N}} c^x \times a_{n_i}^s = c^x \times \left( \#\operatorname{Ext}\sum_{i \in \mathbb{N}} a_{n_i}^s \right) = c^x \times \left( \ast \eta \right)^s + c^x \times \varepsilon_d \in \ast \mathbb{R}_d, \\
\#\operatorname{Ext}\sum_{i \in \mathbb{N}} c^x \times a_{n_i}^s = c^x \times \left( \#\operatorname{Ext}\sum_{i \in \mathbb{N}} a_{n_i}^s \right) = c^x \times \left( \ast \eta \right)^s - c^x \times \varepsilon_d \in \ast \mathbb{R}_d.
\end{align*}
\]

Proof. Copy the proof of the Theorem 2.13.
Theorem 2.16. (1) Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \rightarrow \mathbb{R} \), such that infinite series \( \sum_{n=1}^{\infty} a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta = 0 \). We assume now that:

(i) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{n=1}^{k} a_n > 0 \), or

(ii) there exists \( m > 1 \) such that \( \forall k \geq m : \sum_{n=1}^{k} a_n < 0 \), or

(iii) there exists infinite sequence \( n, j = 1, 2, \ldots \) such that

(a) \( \forall i, m : \sum_{n=1}^{m} a_n > 0 \) and infinite series \( \sum_{n=1}^{\infty} c^n a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta = 0 \) and

(b) there exists infinite sequence \( n, j = 1, 2, \ldots \) such that \( \forall j, m : \sum_{n=1}^{m} a_n < 0 \) and infinite series \( \sum_{n=1}^{\infty} c^n a_n \) absolutely converges in \( \mathbb{R} \) to \( \eta = 0 \).

Then for any \( c \in \mathbb{R}_* \) the equalities is satisfied

\[
\begin{align*}
\# \text{Ext} \sum_{n=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = c^x \times e_{a} \in \mathbb{R}_d, \\
\# \text{Ext} \sum_{n=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = -c^x \times e_{a} \in \mathbb{R}_d.
\end{align*}
\] (2.35)

and

\[
\begin{align*}
\# \text{Ext} \sum_{i=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{i=1}^{\infty} a_n \right) = c^x \times e_{a} \in \mathbb{R}_d, \\
\# \text{Ext} \sum_{i=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{i=1}^{\infty} a_n \right) = -c^x \times e_{a} \in \mathbb{R}_d.
\end{align*}
\] (2.36)

Proof. (1) From Equation (2.31) we obtain

\[
\begin{align*}
\# \text{Ext} \sum_{n=1}^{\infty} a_n &= +e_{a}, \\
\# \text{Ext} \sum_{n=1}^{\infty} a_n &= -e_{a}.
\end{align*}
\] (2.37)

From Equation (2.37) by Theorem 2.1 we obtain directly

\[
\begin{align*}
\# \text{Ext} \sum_{n=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = c^x \times e_{a}, \\
\# \text{Ext} \sum_{n=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = -c^x \times e_{a}.
\end{align*}
\] (2.38)

(2) From Equation (2.32) we obtain

\[
\begin{align*}
\# \text{Ext} \sum_{n=1}^{\infty} a_n &= +e_{a}, \\
\# \text{Ext} \sum_{n=1}^{\infty} a_n &= -e_{a}.
\end{align*}
\] (2.39)

From Equation (2.39) by Theorem 2.1 we obtain directly

\[
\begin{align*}
\# \text{Ext} \sum_{n=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = c^x \times e_{a}, \\
\# \text{Ext} \sum_{n=1}^{\infty} c^n a_n &= c^x \times \left( \# \text{Ext} \sum_{n=1}^{\infty} a_n \right) = -c^x \times e_{a}.
\end{align*}
\] (2.40)

Remark 2.13. Note that we have proved Equation (2.35) and Equation (2.36) without any reference to the
Lemma 2.4.

**Definition 2.18.** (i) Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \), such that
\[
\forall n \left( n \geq m > 0 \right) [a_n > 0] \quad \text{and} \quad \forall n \left( n \leq m - 1 \right) \left[ (a_n = a_m^+) \wedge (a_n \in *\mathbb{R}) \right]
\]  
(2.41)

Then external countable upper sum (\#-sum) of the countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \) is defined by
\[
\#\text{Ext} - \sum_{n=0}^{\infty} a_n = \sum_{n=0}^{m-1} a_n + \#\text{Ext} - \sum_{n=m}^{\infty} a_n
\]
(2.42)

In particular if \( \{a_n\}_{n=1}^{\infty} = \{a_n^+\}_{n=1}^{\infty} \), where \( \forall n \in \mathbb{N} [a_n \in *\mathbb{R}] \) the external countable upper sum (\#-sum) of the countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \) is defined by
\[
\#\text{Ext} - \sum_{n=0}^{\infty} a_n = \sum_{n=0}^{m-1} a_n^+ + \#\text{Ext} - \sum_{n=m}^{\infty} a_n^-
\]
(2.43)

(ii) Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \), such that
\[
\forall n \left( n \geq m > 0 \right) [a_n < 0] \quad \text{and} \quad \forall n \left( n \leq m - 1 \right) \left[ (a_n = a_m^-) \wedge (a_n \in *\mathbb{R}) \right]
\]
(2.44)

Then external countable lower sum (\#-sum) of the countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \) is defined by
\[
\#\text{Ext} - \sum_{n=0}^{\infty} a_n = \sum_{n=0}^{m-1} a_n^- + \#\text{Ext} - \sum_{n=m}^{\infty} a_n^-
\]
(2.45)

In particular if \( \{a_n\}_{n=1}^{\infty} = \{a_n^-\}_{n=1}^{\infty} \), where \( \forall n \in \mathbb{N} [a_n \in *\mathbb{R}] \) the external countable lower sum (\#-sum) of the countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \) is defined by
\[
\#\text{Ext} - \sum_{n=0}^{\infty} a_n = \sum_{n=0}^{m-1} a_n^- + \#\text{Ext} - \sum_{n=m}^{\infty} a_n^-
\]
(2.46)

**Theorem 2.17.** (i) Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \), such that valid the property (2.41).

Then for any \( c \in *\mathbb{R}_s \) the equality is satisfied
\[
c^x \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} a_n \right) = \#\text{Ext} - \sum_{n=0}^{\infty} c^x \times a_n^+ + \#\text{Ext} - \sum_{n=0}^{\infty} c^x \times a_n^-
\]
(2.47)

(ii) Let \( \{a_n\}_{n=1}^{\infty} \) be a countable sequence \( a_n : \mathbb{N} \to *\mathbb{R}_d \), such that valid the property (2.44).

Then for any \( c \in *\mathbb{R}_s \) the equality is satisfied
\[
c^x \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} a_n \right) = \#\text{Ext} - \sum_{n=0}^{\infty} c^x \times a_n^+ + \#\text{Ext} - \sum_{n=0}^{\infty} c^x \times a_n^-
\]
(2.48)

**Proof.** Immediately from Definition 2.18 by Theorem 2.1.

**Definition 2.19.** Let \( \{z_n\}_{n=1}^{\infty} = \{a_n + ib_n\}_{n=1}^{\infty} \) be a countable sequence \( z_n = a_n + ib_n : \mathbb{N} \to \mathbb{C} \) such that infinite
series \( \sum_{n=0}^{\infty} z_n \) absolutely converges in \( \mathbb{C} \). Then external countable complex sum \((\#\text{-sum})\) of the corresponding countable sequence \( z_n : \mathbb{N} \to \mathbb{C} \) is defined by

\[
\#\text{Ext} - \sum_{n=0}^{\infty} z_n^x = \#\text{Ext} - \sum_{n=0}^{\infty} a_n^x + i \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} b_n^y \right),
\]

\[
\#\text{Ext} - \sum_{n=0}^{\infty} z_n^x = \#\text{Ext} - \sum_{n=0}^{\infty} a_n^y + i \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} b_n^z \right),
\]

\[
\#\text{Ext} - \sum_{n=0}^{\infty} z_n^y = \#\text{Ext} - \sum_{n=0}^{\infty} a_n^y + i \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} b_n^z \right),
\]

(2.49)
correspondingly.

Note that any properties of this sum immediately follow from the properties of the real external sum.

**Definition 2.20.** (i) We define now Wattenberg complex plane \( \mathbb{C}^d \) by

\[
\mathbb{C}^d = \mathbb{R}^d \oplus i \times \mathbb{R}^d \quad \text{with} \quad i^2 = -1.
\]

Thus for any \( z \in \mathbb{C}^d \) we obtain \( z = x + iy \), where \( x, y \in \mathbb{R}^d \), (ii) for any \( z \in \mathbb{C}^d \) such that \( z = x + iy \) we define \( |z|^2 \) by \( |z|^2 = x^2 + y^2 \in \mathbb{R}^d \).

**Theorem 2.18.** Let \( \{z_n\}_{n=0}^{\infty} = \{a_n + ib_n\}_{n=0}^{\infty} \) be a countable sequence \( z_n = a_n + ib_n : \mathbb{N} \to \mathbb{C} \) such that infinite series \( \sum_{n=0}^{\infty} z_n \) absolutely converges in \( \mathbb{C} \) to \( z = \zeta_1 + i \zeta_2 \) and \( |z| \neq \infty \). Then

\[
\#\text{Ext} - \sum_{n=0}^{\infty} z_n^x = \#\text{Ext} - \sum_{n=0}^{\infty} a_n^y + i \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} b_n^z \right) = \left( \zeta_1 \right)^x + i \left( \zeta_2 \right)^y - \epsilon_d \quad (1 + i)\#\text{Ext} - \sum_{n=0}^{\infty} z_n^y = \#\text{Ext} - \sum_{n=0}^{\infty} a_n^y + i \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} b_n^z \right) = \left( \zeta_1 \right)^y + i \left( \zeta_2 \right)^y + \epsilon_d \quad (1 + i)\#\text{Ext} - \sum_{n=0}^{\infty} z_n^y = \#\text{Ext} - \sum_{n=0}^{\infty} a_n^y + i \times \left( \#\text{Ext} - \sum_{n=0}^{\infty} b_n^z \right) = \left( \zeta_1 \right)^y + i \left( \zeta_2 \right)^y + \epsilon_d \quad (1 + i)
\]

(2.49)

**2.9. Gonshor Transfer**

**Definition 2.21.** [7]. Let \( [S]_d = \{x \mid \exists y \in S \mid x \leq y\} \).

Note that \( [S]_d \) satisfies the usual axioms for a closure operator, i.e. if (i) \( S \neq \emptyset, S' \neq \emptyset \) and (ii) \( S \) has no maximum, then \( [S]_d \in \mathbb{R}^d \).

Let \( f \) be a continuous strictly increasing function in each variable from a subset of \( \mathbb{R}^n \) into \( \mathbb{R} \). Specifically, we want the domain to be the cartesian product \( \prod_{i=1}^{n} A_i \), where \( A_i = \{x \mid a_i \leq x \} \) for some \( a_i \in \mathbb{R} \). By Robinson transfer \( f \) extends to a function \( *f : *\mathbb{R}^n \to *\mathbb{R} \) from the corresponding subset of \( *\mathbb{R}^n \) into \( *\mathbb{R} \) which is also strictly increasing in each variable and continuous in the \( Q \) topology (i.e. \( \varepsilon \) and \( \delta \) range over arbitrary positive elements in \( *\mathbb{R} \)). We now extend \( *f \) to \( [f]_d \)
\[ [\cdot f] : \mathbb{R}_d \to \mathbb{R}_d. \] (2.50)

**Definition 2.22.** [7] Let \( \alpha, \beta \in \mathbb{R}_d, \ \alpha > a, \ b \in \mathbb{R}, \) then
\[ [\cdot f](\alpha, \beta, \ldots, \beta) = \left[ \left[ \cdot f(b_1, b_2, \ldots, b_n) \right] a, b \in \mathbb{R} \right]. \] (2.51)

**Theorem 2.19.** [7] If \( f \) and \( g \) are functions of one variable then
\[ [\cdot (f \cdot g)](\alpha) = \left[ \left[ \cdot f \right] \left( \left[ \cdot g \right](\alpha) \right) \right]. \] (2.52)

**Theorem 2.20.** [7] Let \( f \) be a function of two variables. Then for any \( a \in \mathbb{R} \) and \( b \in \mathbb{R} \)
\[ [\cdot f](a, b) = \left[ \left[ \cdot f(b, c) \right] b \in \mathbb{R}, \right]. \] (2.53)

**Theorem 2.21.** [7] Let \( f \) and \( g \) be any two terms obtained by compositions of strictly increasing continuous functions possibly containing parameters in \( \mathbb{R}^* \). Then any relation \( f = g \) or \( f < g \) valid in \( \mathbb{R} \) extends to \( \mathbb{R}_d \), i.e.
\[ [\cdot f](\alpha) = [\cdot g](\alpha) \text{ or } [\cdot f](\alpha) < [\cdot g](\alpha). \] (2.54)

**Remark 2.14.** For any function \( f : \mathbb{R}^* \to \mathbb{R} \) we often write for short \( f^* \) instead of \( [\cdot f] \).

**Theorem 2.22.** [7] (1) For any \( a, b \in \mathbb{R}_d \),
\[ \begin{aligned}
\exp^*(a + b^*) &= \exp^*(a^*) \exp^*(b^*), \\
\exp^*(a + b^*) &= \exp^*(b^*a^*).
\end{aligned} \] (2.55)

For any \( a, b \in \mathbb{R}_d, a, b > 0 \)
\[ \begin{aligned}
\exp^*(\alpha + \beta) &= \exp^*(\alpha) \exp^*(\beta), \\
\exp^*(\alpha + \beta) &= \exp^*(\beta \alpha).
\end{aligned} \] (2.56)

(2) For any \( a, b \in \mathbb{R}^* \)
\[ (a^*)^b = (a^b)^*, \] (2.57)

(3) For any \( a, b, c \in \mathbb{R}_d, a, b, c > 0 \)
\[ (a^b)^c = a^{bc} \] (2.58)

(4) For any \( a \in \mathbb{R}^* \)
\[ \begin{aligned}
\ln^*(\exp^*(a^*)) &= a^*, \\
\exp^*(\ln^*(a^*)) &= a^*.
\end{aligned} \] (2.59)

Note that we must always beware of the restriction in the domain when it comes to multiplication.

**Theorem 2.23.** [7] The map \( \alpha \mapsto [\exp^*(\alpha)] \) maps the set of additive idempotents onto the set of all multiplicative idempotents other than 0.

### 3. The Proof of the \#-Transcendence of the Numbers \( e^k, k \in \mathbb{N} \)

In this section we will prove the \#-transcendence of the numbers \( e^k, k \in \mathbb{N} \). Key idea of this proof reduction of the statement of e is \#-transcendental number to equivalent statement in \( \mathbb{R}_d \) by using pseudoring of Wattenberg hyperreals \( \mathbb{R}_d \supset \mathbb{R}_d \) [6] and Gonshor idempotent theory [7]. We obtain this reduction by three steps, see Subsections 3.2.1 - 3.2.3.
3.1. The Basic Definitions of the Shidlovsky Quantities

In this section we remind the basic definitions of the Shidlovsky quantities [8]. Let \( M_0 (n, p), M_k (n, p) \) and \( \varepsilon_k (n, p) \) be the Shidlovsky quantities:

\[
M_0 (n, p) = \int_0^{\infty} \frac{x^{p-1} [(x-1)\cdots(x-n)]^p e^{-x}}{(p-1)!} \, dx \neq 0, \quad (3.1)
\]

\[
M_k (n, p) = e^k \int_0^{\infty} \frac{x^{p-1} [(x-1)\cdots(x-n)]^p e^{-x}}{(p-1)!} \, dx, \quad k = 1, 2, \ldots \quad (3.2)
\]

\[
\varepsilon_k (n, p) = e^k \int_0^{\infty} \frac{x^{p-1} [(x-1)\cdots(x-n)]^p e^{-x}}{(p-1)!} \, dx, \quad k = 1, 2, \ldots \quad (3.3)
\]

where \( p \in \mathbb{N} \) this is any prime number. Using Equations (3.1)-(3.3) by simple calculation one obtains:

\[
M_k (n, p) + \varepsilon_k (n, p) = e^k M_0 (n, p) \neq 0, k = 1, 2, \ldots \quad (3.4)
\]

and consequently

\[
e^k = \frac{M_k (n, p) + \varepsilon_k (n, p)}{M_0 (n, p)}, \quad k = 1, 2, \ldots \quad (3.5)
\]

**Lemma 3.1.** [8]. Let \( p \) be a prime number. Then \( M_0 (n, p) = (-1)^n (n!)^p + p \Theta_1, \Theta_1 \in \mathbb{Z} \).

**Proof.** ([8], p. 128) By simple calculation one obtains the equality

\[
x^{p-1} [(x-1)\cdots(x-n)]^p = (-1)^n (n!)^p x^{p-1} + \sum_{\mu=1}^{\lfloor n/p \rfloor} c_{\mu-1} x^{\mu-1}, \quad (3.6)
\]

where \( p \) is a prime. By using equality \( \Gamma (\mu) = \int_0^{\infty} x^{\mu-1} e^{-x} \, dx = (\mu - 1)! \), where \( \mu \in \mathbb{N} \), from Equations (3.1) and (3.6) one obtains

\[
M_0 (n, p) = (-1)^n (n!)^p \frac{\Gamma (p)}{(p-1)!} + \sum_{\mu=1}^{\lfloor n/p \rfloor} c_{\mu-1} \Gamma (\mu) \frac{(p-\mu)}{(p-1)!} = (-1)^n (n!)^p + c_p p + c_{p+1} p (p+1) + \cdots \quad (3.7)
\]

Thus

\[
M_0 (n, p) = (-1)^n (n!)^p + p \cdot \Theta_1 (n, p), \Theta_1 (n, p) \in \mathbb{Z}. \quad (3.8)
\]

**Lemma 3.2.** [8]. Let \( p \) be a prime number. Then \( M_k (n, p) = p \cdot \Theta_2 (n, p), \Theta_2 (n, p) \in \mathbb{Z}, \quad k = 1, 2, \ldots, n \).

**Proof.** ([8], p. 128) By substitution \( x = k + u \Rightarrow dx = du \) from Equation (3.3) one obtains

\[
M_k (n, p) = \int_0^{\infty} \frac{(u+k)^{p-1} [(u+k-1)\cdots u\cdots(u+k-n)]^p e^{-u}}{(p-1)!} \, du, \quad k = 1, 2, \ldots \quad (3.9)
\]

By using equality

\[
(u+k)^{p-1} [(u+k-1)\cdots u\cdots(u+k-n)]^p = \sum_{\mu=p+1}^{\lfloor (n+1)/p \rfloor} d_{\mu-1} u^{\mu-1}, \quad (3.10)
\]

where \( d_{\mu} \in \mathbb{Z}, \mu = p, p + 1, \ldots, \lfloor (n+1)/p \rfloor - 1 \), and by substitution Equation (3.10) into RHS of the Equation (3.9) one obtains
\[ M_k(n, p) = \frac{1}{(p-1)!} \int_0^{\frac{n}{p-1}} \sum_{m=p-1}^{\infty} d_m u^{m-1} du = p \cdot \Theta_2(n, p), \quad (3.11) \]

\[ \Theta_2(n, p) \in \mathbb{Z}, k = 1, 2, \ldots. \]

**Lemma 3.3.** [8]. (i) There exists sequences \( a(n), n \in \mathbb{N} \) and \( g(n), n \in \mathbb{N} \) such that

\[ |\varepsilon_k(n, p)| \leq \frac{n \cdot g(n) \cdot [a(n)]^{p-1}}{(p-1)!}, \quad (3.12) \]

where sequences \( a(n), n \in \mathbb{N} \) and \( g(n), n \in \mathbb{N} \) does not depend on number \( p \). (ii) For any \( n \in \mathbb{N} : \varepsilon_k(n, p) \to 0 \) if \( p \to \infty \).

**Proof.** ([8], p. 129) Obviously there exists sequences \( a(n), n \in \mathbb{N} \) and \( g(n), k \in \mathbb{N}, n \in \mathbb{N} \) such that \( a(n), n \in \mathbb{N} \) and \( g(n), n \in \mathbb{N} \) does not depend on number \( p \)

\[ |x(x-1) \cdots (x-n)| < a(n), 0 \leq x \leq n \quad (3.13) \]

and

\[ \left| (x-1) \cdots (x-n)e^{-xi} \right| < g(n), 0 \leq x \leq n, k = 1, 2, \ldots, n. \quad (3.14) \]

Substitution inequalities (3.13)-(3.14) into RHS of the Equation (3.3) by simple calculation gives

\[ \varepsilon_k(n, p) \leq g(n) \frac{[a(n)]^{p-1} e^{-i}}{(p-1)!} \int_0^1 \frac{dx}{(p-1)!} \leq \frac{n \cdot g(n) \cdot [a(n)]^{p-1}}{(p-1)!}. \quad (3.15) \]

Statement (i) follows from (3.15). Statement (ii) immediately follows from a statement (ii).

**Lemma 3.4.** [8]. For any \( k \leq n \) and for any \( \delta \) such that \( 0 < \delta < 1 \) there exists \( p \in \mathbb{N} \) such that

\[ \left| e^k \frac{M_k(n, p)}{M_0(n, p)} \right| < \delta. \quad (3.16) \]

**Proof.** From Equation (3.5) one obtains

\[ \left| e^k \frac{M_k(n, p)}{M_0(n, p)} \right| = \left| \varepsilon_k(n, p) \right| \quad (3.17) \]

From Equation (3.17) by using Lemma 3.3. (ii) one obtains (3.17).

**Remark 3.1.** We remind now the proof of the transcendence of \( e \) following Shidlovsky proof is given in his book [8].

**Theorem 3.1.** The number \( e \) is transcendental.

**Proof.** ([8], pp. 126-129) Suppose now that \( e \) is an algebraic number; then it satisfies some relation of the form

\[ a_0 + \sum_{k=1}^n a_k e^k = 0, \quad (3.18) \]

where \( a_0, a_1, \ldots, a_n \in \mathbb{Z} \) integers and where \( a_0 > 0 \). Having substituted RHS of the Equation (3.5) into Equation (3.18) one obtains

\[ a_0 + \sum_{k=1}^n a_k \frac{M_k(n, p) + \varepsilon_k(n, p)}{M_0(n, p)} = a_0 + \sum_{k=1}^n a_k \frac{M_k(n, p)}{M_0(n, p)} + \sum_{k=1}^n a_k \frac{\varepsilon_k(n, p)}{M_0(n, p)} = 0. \quad (3.19) \]

From Equation (3.19) one obtains

\[ a_0 M_0(n, p) + \sum_{k=1}^n a_k M_k(n, p) + \sum_{k=1}^n a_k \varepsilon_k(n, p) = 0. \quad (3.20) \]
We rewrite the Equation (3.20) for short in the form
\[ a_0 M_o(n, p) + \sum_{k=1}^{n} a_k M_k(n, p) + \sum_{k=1}^{n} a_k \varepsilon_k(n, p) \]
\[ = a_0 M_o(n, p) + \Xi(n, p) + \sum_{k=1}^{n} a_k \varepsilon_k(n, p) = 0, \quad \Xi(n, p) = \sum_{k=1}^{n} a_k M_k(n, p). \] (3.21)

We choose now the integers \( M_1(n, p), M_2(n, p), \ldots, M_a(n, p) \) such that:
\[ p \mid M_1(n, p), p \mid M_2(n, p), \ldots, p \mid M_a(n, p), \text{ where } p > |a_0| \] (3.22)
and \( p \nmid M_o(n, p) \). Note that \( p \mid \Xi(n, p) \). Thus one obtains
\[ p \nmid a_0 M_o(n, p) + \Xi(n, p) \] (3.23)
and therefore
\[ a_0 M_o(n, p) + \Xi(n, p) \in \mathbb{Z}, \text{ where } a_0 M_o(n, p) + \Xi(n, p) \neq 0. \] (3.24)

By using Lemma 3.4 for any \( \delta \) such that \( 0 < \delta < 1 \) we can choose a prime number \( p = p(\delta) \) such that:
\[ \left| \sum_{k=1}^{n} a_k \varepsilon_k(n, p) \right| < \delta \sum_{k=1}^{n} |a_k| = \epsilon < 1. \] (3.25)

From (3.25) and Equation (3.21) we obtain
\[ a_0 M_o(n, p) + \Xi(n, p) + \epsilon = 0. \] (3.26)

From (3.26) and Equation (3.24) one obtains the contradiction. This contradiction finalized the proof.

3.2. The Proof of the \#-Transcendence of the Numbers \( e^k, k \in \mathbb{N} \). We Will Divide the Proof into Four Parts

3.2.1. Part I. The Robinson Transfer of the Shidlovsky Quantities \( M_e(n, p), M_e(n, p), \varepsilon_e(n, p) \)

In this subsection we will replace using Robinson transfer the Shidlovsky quantities
\( M_o(n, p), M_k(n, p), \varepsilon_k(n, p) \) by corresponding nonstandard quantities \( \ast M_o(n, p), \ast M_k(n, p), \ast \varepsilon_k(n, p) \).

The properties of the nonstandard quantities \( \ast M_o(n, p), \ast M_k(n, p), \ast \varepsilon_k(n, p) \) one obtains directly from the properties of the standard quantities \( M_o(n, p), M_k(n, p), \varepsilon_k(n, p) \) using Robinson transfer principle [4] [5].

1. Using Robinson transfer principle [4] [5] from Equation (3.8) one obtains directly
\[ \ast M_o(n, p) = (-1)^* n! + p \times \Theta_1(n, p), \quad \ast \Theta_1(n, p) \in \ast \mathbb{Z}_\infty, n, p \in \ast \mathbb{N}_\infty, \ast \neq \ast \mathbb{N} \setminus \mathbb{N}. \] (3.27)

From Equation (3.11) using Robinson transfer principle one obtains \( \forall k (k \in \mathbb{N}): \)
\[ \ast M_k(n, p) = p \times (\ast \Theta_2(n, p)), \quad \ast \Theta_2(n, p) \in \ast \mathbb{Z}_\infty, k = 1, 2, \ldots, k \in \mathbb{N}, n, p \in \ast \mathbb{N}_\infty. \] (3.28)

Using Robinson transfer principle from inequality (3.15) one obtains \( \forall k (k \in \mathbb{N}): \)
\[ \ast \varepsilon_k(n, p) \leq \frac{n \cdot (\ast g(n)) \cdot \left[ \left[ n \cdot (\ast g(n)) \right]^{p-1} \right]}{(p-1)!}, k = 1, 2, \ldots, k \in \mathbb{N}, n, p \in \ast \mathbb{N}_\infty. \] (3.29)

Using Robinson transfer principle, from Equation (3.5) one obtains \( \forall k (k \in \mathbb{N}): \)
\[ e^\ast (e^k) = \frac{\ast M_k(n, p) + (\ast \varepsilon_k(n, p))}{\ast M_o(n, p)}, k = 1, 2, \ldots, k \in \mathbb{N}, n, p \in \ast \mathbb{N}_\infty. \] (3.30)

Lemma 3.5. Let \( n \in \ast \mathbb{N}_\infty \), then for any \( k \in \mathbb{N} \) and for any \( \delta \in \ast \mathbb{R} \) there exists \( p \in \ast \mathbb{N}_\infty \) such that
\[ \left| e^\ast - \frac{\ast M_k(n, p)}{\ast M_o(n, p)} \right| < \delta. \] (3.31)
Proof. From Equation (3.30) we obtain \( \forall k \in \mathbb{N} \):

\[
\left[ *e^k \right]^n = \left[ *M_k(n,p) \right]^n, \quad k \in \mathbb{N}, n, p \in *\mathbb{N}_w.
\]

From Equation (3.32) and (3.29) we obtain (3.31).

3.2.2. Part II. The Wattenberg Imbedding \( *\left( e^k \right) \) into \( *\mathbb{R}_d \)

In this subsection we will replace by using Wattenberg imbedding \[6\] and Gonshor transfer the nonstandard quantities \( *\left( e^k \right) \) and the nonstandard Shidlovsky quantities \( *M_0(n,p), *M_k(n,p), *e_k(n,p) \) by corresponding Wattenberg quantities \( *\left( e^k \right), *(M_0(n,p))^{*}, *(M_k(n,p))^{*}, *(e_k(n,p))^{*} \). The properties of the Wattenberg quantities \( *\left( e^k \right), *(M_0(n,p))^{*}, *(M_k(n,p))^{*}, *(e_k(n,p))^{*} \) one obtains directly from the properties of the corresponding nonstandard quantities \( *\left( e^k \right), M_0(n,p), M_k(n,p), e_k(n,p) \) using Gonshor transfer principle \[4\] \[7\].

1. By using Wattenberg imbedding \( *\mathbb{R} \longrightarrow *\mathbb{R}_d \), from Equation (3.30) one obtains

\[
\left[ *\left( e^k \right) \right]^n = \left[ *M_k(n,p) \right]^n, \quad k = 1, 2, \cdots; k \in \mathbb{N}, n, p \in *\mathbb{N}_w. \tag{3.33}
\]

2. By using Wattenberg imbedding \( *\mathbb{R} \longrightarrow *\mathbb{R}_d \), and Gonshor transfer (see Subsection 2.9 Theorem 2.19) from Equation (3.27) one obtains

\[
\left[ *\left( e^k \right) \right]^n = \left[ *\left( e^{n!} \right) \right]^n = \left[ *\left( e^n \right) \right]^n, \quad *n \in \mathbb{N}_w, n, p \in *\mathbb{N}_w. \tag{3.34}
\]

3. By using Wattenberg imbedding \( *\mathbb{R} \longrightarrow *\mathbb{R}_d \), from Equation (3.28) one obtains

\[
\left[ *\left( e^k \right) \right]^n = \left[ *\left( e^{*n} \right) \right]^n, \quad *n \in \mathbb{N}_w, k = 1, 2, \cdots; k \in \mathbb{N}, n, p \in *\mathbb{N}_w. \tag{3.35}
\]

Lemma 3.6. Let \( n \in *\mathbb{N}_w \), then for any \( k \in \mathbb{N} \) and for any \( \delta \approx 0, \delta \in *\mathbb{R} \) there exists \( \mathbb{P} \in *\mathbb{N}_w \) such that

\[
\left| *\left( e^k \right) \right| < \delta. \tag{3.36}
\]

Proof. Inequality (3.36) immediately follows from inequality (3.31) by using Wattenberg imbedding \( *\mathbb{R} \longrightarrow *\mathbb{R}_d \) and Gonshor transfer.

3.2.3. Part III. Reduction of the Statement of \( e \) Is \( \#\)-Transcendental Number to Equivalent Statement in \( *\mathbb{R}_d \) Using Gonshor Idempotent Theory

To prove that \( e \) is \( \#\)-transcendental number we must show that \( e \) is not \( w \)-transcendental, i.e., there does not exist real \( \mathbb{Q} \)-analytic function \( g_{\mathbb{Q}}(x) = \sum_{n=0}^{\infty} a_n x^n \) with rational coefficients \( a_0, a_1, \cdots, a_n, \cdots \in \mathbb{Q} \) such that

\[
\sum_{n=0}^{\infty} a_n e^n = 0, \quad \sum_{n=0}^{\infty} |a_n| e^n \neq \infty. \tag{3.37}
\]
Suppose that \( e \) is \( w \)-transcendental, i.e., there exists an \( \mathbb{Q} \)-analytic function \( \widetilde{g}_Q(x) = \sum_{n=0}^{\infty} \tilde{a}_n x^n \) with rational coefficients:

\[
\tilde{a}_0 = \frac{k_0}{m_0}, \tilde{a}_1 = \frac{k_1}{m_1}, \ldots, \tilde{a}_n = \frac{k_n}{m_n}, \ldots \in \mathbb{Q}; \quad |\tilde{a}_0| > 0, \tag{3.38}
\]

such that the equality is satisfied:

\[
\sum_{n=0}^{\infty} \tilde{a}_n e^n = 0.
\]

(3.39)

In this subsection we obtain an reduction of the equality given by Equation (3.39) to equivalent equality given by Equation (3). The main tool of such reduction that external countable sum defined in Subsection 2.8.

**Lemma 3.7.** Let \( \Delta_\varepsilon(k) \) and \( \Delta_\varepsilon^*(k) \) be the sum correspondingly

\[
\Delta_\varepsilon(k) = \tilde{a}_0 + \sum_{n=1}^{k} \tilde{a}_n e^n,
\]

\[
\Delta_\varepsilon^*(k) = \sum_{n=k+1}^{\infty} \tilde{a}_n e^n.
\]

(3.40)

Then \( \Delta_\varepsilon(k) \neq 0, k = 1, 2, \ldots \)

**Proof.** Suppose there exists \( k \) such that \( \Delta_\varepsilon(k) = 0 \). Then from Equation (3.39) follows \( \Delta_\varepsilon(k) = 0 \). Therefore by Theorem 3.1 one obtains the contradiction.

**Remark 3.2.** Note that from Equation (3.39) follows that in general case there is a sequence \( \{m_i\}_{i=1}^{\infty} \) such that

\[
\lim_{i \to \infty} m_i = \infty, \quad \forall (i \in \mathbb{N}) \left[ \sum_{n=1}^{m_i} \tilde{a}_n e^n < 0 \right], \quad \tilde{a}_0 + \lim_{i \to \infty} \left( \sum_{n=1}^{m_i} \tilde{a}_n e^n \right) = 0,
\]

(3.41)

or there is a sequence \( \{m_j\}_{j=1}^{\infty} \) such that

\[
\lim_{j \to \infty} m_j = \infty, \quad \forall (j \in \mathbb{N}) \left[ \sum_{n=1}^{m_j} \tilde{a}_n e^n > 0 \right], \quad \tilde{a}_0 + \lim_{j \to \infty} \left( \sum_{n=1}^{m_j} \tilde{a}_n e^n \right) = 0,
\]

(3.42)

or both sequences \( \{m_i\}_{i=0}^{\infty} \) and \( \{m_j\}_{j=0}^{\infty} \) with a property that is specified above exist.

**Remark 3.3.** We assume now for short but without loss of generality that (3.41) is satisfied. Then from (3.41) by using Definition 2.17 and Theorem 2.14 (see Subsection 2.8) one obtains the equality [4]

\[
\left( \tilde{a}_0 \right)^{\varepsilon} + \# \text{Ext} \sum_{n \in \mathbb{N}} (\varepsilon a_n)^{\varepsilon} \times (\varepsilon e^n)^{\varepsilon} = -e_{\varepsilon}^{\varepsilon}.
\]

(3.43)

**Remark 3.4.** Let \( \Delta_\varepsilon(k) \) and \( \Delta_{\varepsilon}^*(k) \) be the upper external sum defined by

\[
\Delta_\varepsilon(k) = \tilde{a}_0 + \sum_{n=1}^{k} (\varepsilon a_n)^{\varepsilon} \times (\varepsilon e^n)^{\varepsilon},
\]

\[
\Delta_{\varepsilon}^*(k) = \# \text{Ext} - \sum_{n=k+1}^{\infty} (\varepsilon a_n)^{\varepsilon}.
\]

(3.44)

Note that from Equation (3.43)-Equation (3.44) follows that

\[
\Delta_\varepsilon(k) + \Delta_{\varepsilon}^*(k) = -e_{\varepsilon}^{\varepsilon}.
\]

(3.45)

**Remark 3.5.** Assume that \( \alpha, \beta \in \mathbb{R}_d \) and \( \beta \notin \mathbb{R} \). In this subsection we will write for a short \( ab[\alpha|\beta] \)
iff $\beta$ absorbs $\alpha$, i.e. $\beta + \alpha = \beta$.

**Lemma 3.8.** $-ab\left[\Delta_{\alpha}^k(\Delta_{\alpha}^k)\right], k = 1, 2, \ldots$

**Proof.** Suppose there exists $k \in \mathbb{N}$ such that $ab\left[\Delta_{\alpha}^k(\Delta_{\alpha}^k)\right]$. Then from Equation (3.45) one obtains

$$\Delta_{\alpha}^k(\Delta_{\alpha}^k) = -e_d.$$  (3.46)

From Equation (3.46) by Theorem 2.11 follows that $\Delta_{\alpha}(\Delta_{\alpha}) = 0$ and therefore by Lemma 3.7 one obtains the contradiction.

**Theorem 3.2.** [4] The equality (3.43) is inconsistent.

**Proof.** Let us consider hypernatural number $\mathcal{I} \in \mathbb{N}_\infty$ defined by countable sequence

$$\mathcal{I} = \left(\cdot \cdot \cdot, m_m \times m_{m_1} \times m_{m_2} \times \cdots \times m_n, \cdots\right)$$  (3.47)

From Equation (3.43) and Equation (3.47) one obtains

$$\mathcal{I} \times \left(\cdot \cdot \cdot, a_{m_1} \times a_{m_2} \times a_{m_{m_1}} \times \cdots \times a_{m_n}, \cdots\right) = -\mathcal{I} \times e_d.$$  (3.48)

**Remark 3.6.** Note that from inequality (3.27) by Wattenberg transfer one obtains

$$\left(\cdot \cdot \cdot, \epsilon_{n}(n)\right) \leq \left(\cdot \cdot \cdot, g_{n}(n)\right) \cdot \left(\cdot \cdot \cdot, (\epsilon(n))^{(p-1)!}, n \in \mathbb{N}, n, p \in \mathbb{N}_\infty.\right)$$  (3.49)

Substitution Equation (3.30) into Equation (3.48) gives

$$\mathcal{I}^p + \left(\cdot \cdot \cdot, \sum_{n \in \mathbb{N} \setminus \{0\}} (\mathcal{I})^p \times (\cdot \cdot \cdot, \epsilon_{n})^p\right) = \mathcal{I}^p + \left(\cdot \cdot \cdot, \sum_{n \in \mathbb{N}} (\mathcal{I})^p \times \left(\cdot \cdot \cdot, \epsilon_{n}(n)\right)^p + \left(\cdot \cdot \cdot, \epsilon_{n}(n)\right)^p\right)^p = -\mathcal{I}^p \times e_d.$$  (3.50)

Multiplying Equation (3.50) by Wattenberg hyperinteger $\left(\cdot \cdot \cdot, M_{\alpha}(n,p)\right)^p \in \mathbb{Z}_d$ by Theorem 2.13 (see subsection 2.8) one obtains

$$\mathcal{I}^p \times \left(\cdot \cdot \cdot, M_{\alpha}(n,p)\right)^p + \left(\cdot \cdot \cdot, \sum_{n \in \mathbb{N}} (\mathcal{I})^p \times \left(\cdot \cdot \cdot, M_{\alpha}(n,p)\right)^p + \left(\cdot \cdot \cdot, \epsilon_{n}(n)\right)^p\right)$$

$$= -\mathcal{I}^p \times \left(\cdot \cdot \cdot, M_{\alpha}(n,p)\right)^p \times e_d.$$  (3.51)

By using inequality (3.49) for a given $\delta \in \mathbb{R}$, $\delta \approx 0$ we will choose infinite prime integer $p \in \mathbb{N}_\infty$ such that:

$$\sum_{n \in \mathbb{N}} (\mathcal{I})^p \times \left(\cdot \cdot \cdot, \epsilon_{n}(n)\right)^p \leq \mathcal{I}^p \times \left(\cdot \cdot \cdot, M_{\alpha}(n,p)\right)^p \times \delta^p \times e_d.$$  (3.52)

Now using the inequality (3.49) we are free to choose a prime hyperinteger $p \in \mathbb{N}_\infty$ and $\delta^p \in \mathbb{R}_d$, $\delta^p = \delta^p(p) \approx 0$ in the Equation (3.51) for a given $\epsilon \in \mathbb{R}$, $\epsilon \approx 0$ such that:

$$\mathcal{I}^p \times \left(\cdot \cdot \cdot, M_{\alpha}(n,p)\right)^p \times \delta^p(p) = \epsilon^p.$$  (3.53)

Hence from Equation (3.52) and Equation (3.53) we obtain

$$\sum_{n \in \mathbb{N}} (\mathcal{I})^p \times \left(\cdot \cdot \cdot, \epsilon_{n}(n)\right)^p \leq -\epsilon^p \times e_d.$$  (3.54)

Therefore from Equations (3.51) and (3.54) by using definition (2.15) of the function $\text{Int}_p(\alpha)$ given by Equation (2.20)-Equation (2.21) and corresponding basic property 1 (see Subsection 2.7) of the function
\[
\text{Int}_p(\alpha) \quad \text{we obtain}
\]
\[
\text{Int}_p \left( \mathfrak{J}_0 \times \left[ *M_0(n, p) \right]^\theta \right) + \#\text{Ext} \sum_{k \in \mathbb{N}} \left( \mathfrak{J}_k \times \left[ *M\kappa(n, p) \right]^\theta \right) + \mathfrak{J}_n \times \left[ *e_n(n, p) \right]^\theta
\]
\[
= \mathfrak{J}_0 \times \left[ *M_0(n, p) \right]^\theta + \#\text{Ext} \sum_{k \in \mathbb{N}} \left( \mathfrak{J}_k \times \left[ *M\kappa(n, p) \right]^\theta \right)
\]
\[
= -\text{Int}_p \left( \mathfrak{J}_0 \times \left[ *M_0(n, p) \right]^\theta \right) \times e_d
\]
\[(3.55)\]

From Equation (3.55) using basic property \( I \) of the function \( \text{Int}_p(\alpha) \) finally we obtain the main equality
\[
\mathfrak{J}_0 \times \left[ *M_0(n, p) \right]^\theta + \#\text{Ext} \sum_{k \in \mathbb{N}} \left( \mathfrak{J}_k \times \left[ *M\kappa(n, p) \right]^\theta \right) = \mathfrak{J}_0 \times \left[ *M_0(n, p) \right]^\theta \times e_d.
\]

We will choose now infinite prime integer \( p \) in Equation (3.56) \( p \in \mathbb{N}_\infty \) such that
\[
\hat{p}^\theta > \max \left( \left\lfloor \mathfrak{J}_0 \right\rfloor, n \right) \quad \quad (3.57)
\]

Hence from Equation (3.34) follows
\[
\hat{p}^\theta \uparrow \left[ *M_0(n, \hat{p}) \right]^\theta.
\]

Note that \( \left[ *M_0(n, \hat{p}) \right]^\theta \neq 0^\theta \). Using (3.57) and (3.58) one obtains:
\[
\hat{p}^\theta \uparrow \left[ *M_0(n, \hat{p}) \right]^\theta \times (\mathfrak{J}_0)^\theta.
\]

Using Equation (3.35) one obtains
\[
\hat{p}^\theta \uparrow \left[ *M_\kappa(n, \hat{p}) \right]^\theta, n = 1, 2, \ldots.
\]

3.2.4. Part IV. The Proof of the Inconsistency of the Main Equality (3.56)
In this subsection we will prove that main equality (3.56) is inconsistent. This proof based on the Theorem 2.10 (v), see Subsection 2.6.

**Lemma 3.9.** The equality (3.56) under conditions (3.59)-(3.60) is inconsistent.

**Proof.** (I) Let us rewrite Equation (3.56) in the short form
\[
\Gamma(n, \hat{p}) + \Sigma^\kappa(n, \hat{p}) = -\Lambda^\kappa(\hat{p}) \times e_d,
\]

where
\[
\left\{ \begin{aligned}
\Sigma^\kappa(n, \hat{p}) &= \#\text{Ext} \sum_{k \in \mathbb{N}} \left( \mathfrak{J}_k \times \left[ *M\kappa(n, \hat{p}) \right]^\theta \right), \\
\Gamma(n, \hat{p}) &= \mathfrak{J}_0 \times \left[ *M_0(n, \hat{p}) \right]^\theta, \\
\Lambda^\kappa(\hat{p}) &= \mathfrak{J}_0 \times \left[ *M_0(n, \hat{p}) \right]^\theta.
\end{aligned} \right.
\]

From (3.59)-(3.60) follows that
\[
\left\{ \begin{aligned}
\hat{p}^\theta \uparrow \Gamma(n, \hat{p}), \\
\hat{p}^\theta \uparrow \Sigma^\kappa(n, \hat{p}).
\end{aligned} \right.
\]

**Remark 3.7.** Note that \( \Sigma^\kappa(n, \hat{p}) \notin \mathbb{R}^\theta \). Otherwise we obtain that \( \text{ab.p} \left( \Gamma(n, \hat{p}) + \Sigma^\kappa(n, \hat{p}) \right) = \{ \emptyset \} \). But the other hand from Equation (3.61) follows that \( \text{ab.p} \left( \Gamma(n, \hat{p}) + \Sigma^\kappa(n, \hat{p}) \right) = -\Lambda^\kappa(\hat{p}) \times e_d \). But this is a contradiction. This contradiction completed the proof of the statement (I).

(II) Let \( \tilde{\mathfrak{J}}_k(n, \hat{p}), \tilde{\mathfrak{J}}_\kappa(n, \hat{p}), \tilde{\mathfrak{J}}_\kappa(k, k_\kappa, n, \hat{p}) \) and \( \tilde{\mathfrak{J}}_\kappa(k, n, \hat{p}, \varepsilon^\kappa_n) \), be the external sum
Note that from Equation (3.61) and Equation (3.64) follows that
\[ \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}) + \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}) = -\Lambda^x (\hat{\mathbf{p}}) \times \mathbf{e}_d. \]  
(3.65)

**Lemma 3.10.** Under conditions (3.59)-(3.60)
\[ -ab \left[ \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n) \right]^k \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n), k = 1, 2, \ldots \]  
(3.66)
and
\[ -ab \left[ \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n) \right]^k \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n), k = 1, 2, \ldots \]  
(3.67)

**Proof.** First note that under conditions (3.59)-(3.60) one obtains
\[ \forall k \left[ \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n) \neq 0 \right] \]  
(3.68)
Suppose that there exists an \( k \geq 0 \) such that \( ab \left[ \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n) \right]^k \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n). \) Then from Equation (3.65) one obtains
\[ \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n) = -\Lambda^x (\hat{\mathbf{p}}) \times \mathbf{e}_d. \]  
(3.69)
From Equation (3.69) by Theorem 2.17 one obtains
\[ -\mathbf{e}_d = \left[ \Lambda^x (\hat{\mathbf{p}}) \right]^k \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n) = \left[ \Lambda^x (\hat{\mathbf{p}}) \right]^k \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}, \mathbf{e}_n) = \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}). \]  
(3.70)
Thus
\[ -\mathbf{e}_d = \Delta_x^k (k, \mathbf{n}, \hat{\mathbf{p}}). \]  
(3.71)
From Equation (3.71) by Theorem 2.11 follows that \( \Delta_x (k) = 0 \) and therefore by Lemma 3.7 one obtains the contradiction. This contradiction finalized the proof of the Lemma 3.10.

**Part (III)**

**Remark 3.8. (i)** Note that from Equation (3.62) by Theorem 2.10 (v) follows that \( \Sigma^x (\mathbf{n}, \hat{\mathbf{p}}) \) has the form
\[ \Sigma^x (\mathbf{n}, \hat{\mathbf{p}}) = q^x + ab \cdot \mathbf{p} \left( \Sigma^x (\mathbf{n}, \hat{\mathbf{p}}) \right) = q^x + \left( -\Lambda^x (\hat{\mathbf{p}}) \times \mathbf{e}_d \right), \]  
(3.72)
where
\[ q^x \in \Sigma^x (\mathbf{n}, \hat{\mathbf{p}}) = \tilde{\Delta}_x^x (1, \mathbf{n}, \hat{\mathbf{p}}), \mathbf{q} \in \Sigma^x \text{ and } \hat{\mathbf{p}} \mid \mathbf{q}. \]  
(3.73)

(ii) Substitution by Equation (3.72) into Equation (3.61) gives
\[ \Gamma (\mathbf{n}, \hat{\mathbf{p}}) + \Sigma^x (\mathbf{n}, \hat{\mathbf{p}}) = \Gamma (\mathbf{n}, \hat{\mathbf{p}}) + q^x + \left( -\Lambda^x (\hat{\mathbf{p}}) \times \mathbf{e}_d \right) = -\Lambda^x (\hat{\mathbf{p}}) \times \mathbf{e}_d. \]  
(3.74)
**Remark 3.9.** Note that from (3.74) by definitions follows that
\[
ab[\left(\Gamma(n, \hat{p}) + q^\varepsilon\right)] \left[-\Lambda^\varepsilon(\hat{p}) \times \varepsilon_d\right].
\] (3.75)

**Remark 3.10.** Note that from (3.73) by construction of the Wattenberg integer \(\Sigma^w(n, \hat{p})\) obviously follows that there exists some \(k, d \in \mathbb{N}\) such that
\[
\tilde{\Lambda}^\varepsilon(1, k, n, \hat{p}) < q^\varepsilon \leq \tilde{\Lambda}^\varepsilon(1, d, n, \hat{p}), \quad k < d.
\] (3.76)

Therefore
\[
\Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, k, n, \hat{p}) < \Gamma(n, \hat{p}) + q^\varepsilon \leq \Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, d, n, \hat{p}).
\] (3.77)

Note that under conditions (3.59)-(3.60) and (3.73) obviously one obtains
\[
0 \neq \Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, k, n, \hat{p}) < \Gamma(n, \hat{p}) + q^\varepsilon \leq \Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, d, n, \hat{p}) \leq 0, \quad \Gamma(n, \hat{p}) + q^\varepsilon \neq 0.
\] (3.78)

From Equation (3.74) follows that
\[
\Gamma(n, \hat{p}) + q^\varepsilon + \left(-\Lambda^\varepsilon(\hat{p}) \times \varepsilon_d\right) = -\Lambda^\varepsilon(\hat{p}) \times \varepsilon_d.
\] (3.79)

Therefore
\[
\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + q^\varepsilon\right] + (-\varepsilon_d) = -\varepsilon_d.
\] (3.80)

From (3.78) follows that
\[
0 \neq \left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, k, n, \hat{p})\right] < \left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + q^\varepsilon\right]
\leq \left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, d, n, \hat{p})\right] \leq 0,
\] (3.81)

\[
\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + q^\varepsilon\right] \neq 0.
\]

Note that by Theorem 2.8 (see Subsection 2.5) and Formula (3.44) one obtains
\[
0 \neq \text{Wst(\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, k, n, \hat{p})\right])} = \text{Wst}\left(\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + q^\varepsilon\right]\right),
\] (3.82)

\[
\text{Wst(\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + \tilde{\Lambda}^\varepsilon(1, d, n, \hat{p})\right])} \leq 0.
\]

From Equation (3.81)-Equation (3.82) follows that
\[
0 \neq \text{Wst}\left(\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + q^\varepsilon\right]\right) \neq 0.
\] (3.83)

Thus
\[
-\ab\left(\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + q^\varepsilon\right]\right)(-\varepsilon_d)
\] (3.84)

and therefore
\[
\left(\Lambda^\varepsilon(\hat{p})\right)^{-1} \left[\Gamma(n, \hat{p}) + q^\varepsilon\right] + (-\varepsilon_d) \neq -\varepsilon_d.
\] (3.85)

But this is a contradiction. This contradiction completed the proof of the Lemma 3.9.
4. Generalized Shidlovsky Quantities

In this section we remind the basic definitions of the Shidlovsky quantities, see [8] pp. 132-134.

**Theorem 4.1.** [8] Let \( f_l(z), l = 1, 2, \cdots, r \) be a polynomials with coefficients in \( \mathbb{Z} \). Assume that for any \( l = 1, 2, \cdots, r \) algebraic numbers over the field \( \mathbb{Q} : \beta_{i,j}, \cdots, \beta_{k_i,j} \), \( k_i \geq 1, l = 1, 2, \cdots, r \) form a complete set of the roots of \( f_l(z) \) such that

\[
f_l(z) \in \mathbb{Z}[z], \quad \deg f_l(z) = k_i, l = 1, 2, \cdots, r
\]

and \( a_i \in \mathbb{Z}, l = 1, 2, \cdots, r, a_0 \neq 0 \). Then:

\[
a_0 + \sum_{i=1}^{r} a_i \sum_{k=1}^{k_i} e^{\beta_{k_i,j}} \neq 0.
\]

Let \( f_r(z) \) be a polynomial such that

\[
f_r(z) = \prod_{i=1}^{r} f_i(z) = b_0 + b_1z + \cdots + b_N z^N = b_N \prod_{i=1}^{r} \prod_{k=1}^{k_i} (z - \beta_{k_i,j}), b_0 \neq 0, b_N > 0, N_r = \sum_{i=1}^{r} k_i.
\]

Let \( M_0(N_r, p), M_{\beta_j}(N_r, p) \) and \( e_{\beta_j}(N_r, p) \) be the quantities [8]:

\[
M_0(N_r, p) = \int_0^{(N_r-1)p-1} e^{-z} z^{-1} f_r(z) e^{\beta_j} dz / (p-1)!,
\]

where in (4.4) we integrate in complex plane \( \mathbb{C} \) along line \([0, +\infty)\), see **Picture 1**.

\[
M_{\beta_j}(N_r, p) = e^{\beta_j} \int_0^{(N_r-1)p-1} e^{-z} z^{-1} f_r(z) e^{\beta_j} dz / (p-1)!,
\]

where \( k = 1, \cdots, k_i \) and where in (4.5) we integrate in complex plane \( \mathbb{C} \) along line with initial point \( \beta_{k_i,j} \in \mathbb{C} \) and which are parallel to real axis of the complex plane \( \mathbb{C} \), see **Picture 1**.

\[
e_{\beta_j}(N_r, p) = e^{\beta_j} \int_0^{(N_r-1)p-1} e^{-z} z^{-1} f_r(z) e^{\beta_j} dz / (p-1)!,
\]

where \( k = 1, \cdots, k_i \) and where in (4.6) we integrate in complex plane \( \mathbb{C} \) along contour \([0, \beta_{k_i,j}]\), see **Picture 1**.

From Equation (4.3) one obtains

\[
b_N (N_r-1)p z^{p-1} f_r^p(z) = b_N (N_r-1)p b_0 z^{p-1} + \sum_{x=p+1}^{(N_r-1)p} c_x z^{x-1},
\]

where \( b_N, b_0 \neq 0, c_x \in \mathbb{Z}, s = p, \cdots, (N_r-1)p - 1 \). Now from Equation (4.4) and Equation (4.7) using formula

\[
\Gamma(s) = \int_0^{\infty} e^{-z} z^{s-1} dz = (s-1)!, s \in \mathbb{N}
\]
one obtains

\[ M_0(N, p) = b_0^{(N-1)p} \frac{1}{(p-1)!} \int_0^\infty z^{p-1} e^{-z} dz + \sum_{s=p+1}^{(N+1)p} \frac{c_{s-1}}{(p-1)!} \int_0^\infty z^{s-1} e^{-z} dz \]

\[ = b_0^{(N-1)p} \frac{1}{(p-1)!} \int_0^\infty (N-1)^{p-1} z^{s-1} e^{-z} dz \]

\[ = b_0^{(N-1)p} \frac{(s-1)!}{(p-1)!} c_{s-1} = b_0^{(N-1)p} + pC, \]

where \( b_0, b_0 \neq 0, C \in \mathbb{Z} \). We choose now a prime \( p \) such that \( p > \max \{ |a_m|, |b_m|, |b_l| \} \). Then from Equation (4.8) follows that

\[ p \mid a_0 M_0(N, p). \]

From Equation (4.3) and Equation (4.5) one obtains

\[ M_{k,l}(N, p) = \frac{e^{\beta_{k,l}}}{(p-1)!} \int_{b_N}^{b_N+1} \left[ b_0^{(N-1)p} \left( \frac{1}{(p-1)!} \int_0^\infty z^{p-1} e^{-z} dz \right) \left( \prod_{j=1}^r \prod_{j=1}^l \left( z - \beta_{k,l} \right) \right)^p \right] e^{-z/b_{k,l}} dz, \]

where \( k = 1, \cdots, k, l = 1, \cdots, r \). By change of the variable integration \( z = u + \beta_{k,l} \) in RHS of the Equation (4.10) we obtain

\[ M_{k,l}(N, p) = \frac{1}{(p-1)!} \int_0^{b_N+1} \left[ b_0^{(N-1)p} \left( u + \beta_{k,l} \right)^{p-1} u^{p-1} e^{-u} \left( \prod_{j=1}^r \prod_{j=1}^l \left( z + \beta_{k,l} - \beta_{k,l} \right) \right)^p \right] du, \]

where \( k = 1, \cdots, k, l = 1, \cdots, r \). Let us rewrite now Equation (4.11) in the following form

\[ M_{k,l}(N, p) = \frac{1}{(p-1)!} \int_0^{b_N+1} \left[ b_0^{(N-1)p} \left( u + \beta_{k,l} \right)^{p-1} u^{p-1} e^{-u} \left( \prod_{j=1}^r \prod_{j=1}^l \left( b_{N-1} + b_N \beta_{k,l} - b_N \beta_{k,l} \right) \right)^p \right] du, \]

Let \( \mathbb{Z}_A \) be a ring of the all algebraic integers. Note that \[ \alpha_{i,j} = b_N \beta_{k,l} \in \mathbb{Z}_A, i = 1, \cdots, k, j = 1, \cdots, r. \]

Let us rewrite now Equation (4.12) in the following form

\[ M_{k,l}(N, p) = \frac{1}{(p-1)!} \int_0^{b_N+1} \left[ b_0^{(N-1)p} \left( u + \alpha_{k,l} \right)^{p-1} u^{p-1} e^{-u} \left( \prod_{j=1}^r \prod_{j=1}^l \left( b_{N-1} + b_N \alpha_{k,l} - b_N \alpha_{k,l} \right) \right)^p \right] du, \]

where \( k = 1, \cdots, k, l = 1, \cdots, r \). From Equation (4.14) one obtains

\[ \left\{ \sum_{j=1}^r \sum_{k=1}^{b_N} M_{k,l}(N, p) \right\} = \frac{1}{(p-1)!} \int_0^\infty u^{p-1} e^{-u} \Phi_i(u) du, \]

\[ \Phi_i(u) = \sum_{j=1}^r \sum_{k=1}^{b_N} \left[ b_0^{(N-1)p} \left( u + \alpha_{k,l} \right)^{p-1} u^{p-1} e^{-u} \left( \prod_{j=1}^r \prod_{j=1}^l \left( b_{N-1} + b_N \alpha_{k,l} - b_N \alpha_{k,l} \right) \right)^p \right] \]

The polinomial \( \Phi_i(u) \) is a symmetric polynomial on any system \( \Delta_i \) of variables \( \alpha_{i,j}, \alpha_{2,j}, \cdots, \alpha_{k,l} \), where

\[ \Delta_i = \{ \alpha_{i,j}, \alpha_{2,j}, \cdots, \alpha_{k,l} \}, i = 1, \cdots, r. \]

\[ \alpha_{i,j}, \alpha_{2,j}, \cdots, \alpha_{k,l} \in \mathbb{Z}_A, i = 1, \cdots, r. \]

It well known that \( \Phi_i(u) \in \mathbb{Z}[u] \) \[ \Phi_i(u) \in \mathbb{Z}[u] \] and therefore

\[ u^p \Phi_i(u) = \sum_{s=p+1}^{(N+1)p} c_s u^{s-1}, c_s \in \mathbb{Z}. \]
From Equation (4.15) and Equation (4.17) one obtains
\[
\sum_{i=1}^{r} \sum_{k=1}^{k_i} M_{k,j}(N_r, p) = \int_{0}^{\infty} u^{p-1} e^{-u} \Phi_{r}(u) \, du = \sum_{s=p+1}^{\infty} c_{s-1} \int_{0}^{\infty} u^{p-1} e^{-u} \, du
\]
(4.18)
\[
= \sum_{s=p+1}^{\infty} c_{s-1} \frac{(s-1)!}{(p-1)!} = pC, \quad C \in \mathbb{Z}.
\]
Therefore
\[
\Xi(N_r, p) = \sum_{i=1}^{r} \sum_{k=1}^{k_i} M_{k,j}(N_r, p) \in \mathbb{Z}, \quad p|\Xi(N_r, p).
\]
(4.19)

Let \( O_\beta \subset \mathbb{C} \) be a circle with the centre at point \((0,0)\). We assume now that \( \forall k\forall \beta_{kl} \in O_\beta \). We will designate now
\[
g_{klj}(r) = \max_{|k| \neq 0} \left| b_{N_r}^{-1} f_r(z) e^{z \beta_{klj}} \right|, \\
g_0(r) = \max_{|k| \neq 0} g_{klj}(r), \quad g(r) = \max_{|k| \neq 0} \left| b_{N_r}^{-1} z f_r(z) \right|.
\]
(4.20)

From Equation (4.6) and Equation (4.20) one obtains
\[
\left| \epsilon_{k,l}(N_r, p) \right| = \left\| \int_{0}^{\infty} b_{N_r}^{-1} f_r(z) e^{z \beta_{klj}} \, dz \right\| (p-1)! \\
\leq \frac{1}{(p-1)!} \int_{0}^{\infty} b_{N_r}^{-1} f_r(z) e^{z \beta_{klj}} \left| b_{N_r}^{-1} z f_r(z) \right|^{p-1} \, dz \\
\leq g_0(r) g^{p-1}(r) |\beta_{klj}| \leq g_0(r) g^{p-1}(r) R \quad (p-1)!,
\]
(4.21)

where \( k = 1, \cdots, k_r, l = 1, \cdots, r \). Note that
\[
g_0(r) g^{p-1}(r) R \to 0 \quad \text{if} \quad p \to \infty.
\]
(4.22)

From (4.22) follows that for any \( \epsilon \in [0, \delta] \) there exists a prime number \( p \) such that
\[
\sum_{i=1}^{r} \sum_{k=1}^{k_i} \epsilon_{k,i}(N_r, p) = \epsilon(p) < 1.
\]
(4.23)

where \( k = 1, \cdots, k_r, l = 1, \cdots, r \). From Equation (4.4)-Equation (4.6) follows
\[
e^{\beta_{klj}} = \frac{M_{k,j}(N_r, p) + \epsilon_{k,j}(N_r, p)}{M_0(N_r, p)}
\]
(4.24)

where \( k = 1, \cdots, k_r, l = 1, \cdots, r \). Assume now that
\[
a_0 + \sum_{i=1}^{r} \sum_{k=1}^{k_i} e^{\beta_{klj}} = 0.
\]
(4.25)

Having substituted RHS of the Equation (4.24) into Equation (4.25) one obtains
\[
a_0 + \sum_{i=1}^{r} \sum_{k=1}^{k_i} M_{k,j}(N_r, p) + \epsilon_{k,j}(N_r, p) = a_0 + \sum_{i=1}^{r} \sum_{k=1}^{k_i} M_{k,j}(N_r, p) + \sum_{i=1}^{r} \sum_{k=1}^{k_i} \epsilon_{k,j}(N_r, p) = 0.
\]
(4.26)

From Equation (4.26) by using Equation (4.19) one obtains
\[
a_0 + \Xi(N_r, p) + \sum_{i=1}^{r} \sum_{k=1}^{k_i} \epsilon_{k,j}(N_r, p) = 0.
\]
(4.27)
We choose now a prime \( p \in \mathbb{N} \) such that \( p > \max \left( |a_0|, |a_1|, |b_{0,j}| \right) \) and \( \epsilon(p) < 1 \). Note that \( p \mid \Xi(N_*, p) \) and therefore from Equation (4.19) and Equation (4.27) one obtains the contradiction. This contradiction completed the proof.

5. Generalized Lindemann-Weierstrass Theorem

**Theorem 5.1.** [4] Let \( f_j(z), l = 1, 2, \cdots \), be a polynomials with coefficients in \( \mathbb{Z} \). Assume that for any \( l \in \mathbb{N} \) algebraic numbers over the field \( \mathbb{Q} : \beta_{1,l}, \cdots, \beta_{k_l,l} \), \( k_l \geq 1, l = 1, 2, \cdots \), form a complete set of the roots of \( f_j(z) \) such that

\[
f_j(z) \in \mathbb{Z}[z], \deg f_j(z) = k_l, l = 1, 2, \cdots
\] (5.1)

and \( a_l \in \mathbb{Q}, a_0 \neq 0, l = 1, 2, \cdots, r, r = 1, 2, \cdots \). We assume now that

\[
\sum_{l=0}^{r} |a_l| \sum_{k=1}^{k_l} |b_{0,j}| < \infty.
\] (5.2)

Then

\[
a_0 + \sum_{l=0}^{r} a_l \sum_{k=1}^{k_l} e^{\beta_{0,j}} \neq 0.
\] (5.3)

We will divide the proof into three parts.

**Part I. The Robinson transfer**

Let \( f(z) = f_k(z) = \prod_{l=1}^{r} f_l(z) = b_0 + b_1z + \cdots + b_Nz^N \)

\[
= b_N \prod_{l=1}^{r} \prod_{k=1}^{k_l} \left( z - \left( \beta_{0,j} \right) \right), b_0 \neq 0, b_N > 0,
\] (5.4)

\[
N = N_\epsilon = \sum_{k=1}^{r} k_l \in \mathbb{N}_*,
\]

Let \( *M_0(N,p) \), \( *M_{k_l}(N,p) \) and \( *E_{k_l}(N,p) \) be the quantities:

\[
*M_0(N,p) = \int_{0}^{(r)} b_0 N^{N-1-p-1} z^{p-1} f^p(z) \left[ *e^{\beta_{0,j}} \right] \frac{dz}{(p-1)!}, \text{ } N, p \in \mathbb{N}_*,
\] (5.5)

where in (5.5) we integrate in nonstandard complex plane \( *C \) along line \( *[0, +\infty] \), see Picture 1.

\[
*M_{k_l}(N,p) = \left( *e^{\beta_{0,j}} \right) \int_{0}^{(r)} b_0 N^{N-1-p-1} z^{p-1} f^p(z) \left[ *e^{\beta_{0,j}} \right] \frac{dz}{(p-1)!}, \text{ } N, p \in \mathbb{N}_*,
\] (5.6)

where \( k_l = 1, \cdots, k_l \) and where in (5.6) we integrate in nonstandard complex plane \( *C \) along line with initial point \( *\beta_{0,j} \in *C \) which are parallel to real axis of the complex plane \( *C \), see Picture 1.

\[
*E_{k_l}(N,p) = \left( *e^{\beta_{0,j}} \right) \int_{0}^{(r)} b_0 N^{N-1-p-1} z^{p-1} f^p(z) \left[ *e^{\beta_{0,j}} \right] \frac{dz}{(p-1)!}, \text{ } N, p \in \mathbb{N}_*,
\] (5.7)

where \( k_l = 1, \cdots, k_l \) and where in (5.7) we integrate in nonstandard complex plane \( *C \) along contour \( *[0, *\beta_{k_l}] \), see Picture 1.

1. Using Robinson transfer principle [4]-[6] from Equation (5.5) and Equation (4.8) one obtains directly

\[
*M_0(N,p) = b_0 N^{N-1-p} b_0^p + pC,
\] (5.8)
where \( b_N b_0 \neq 0, C \in \mathbb{Z}_a \). We choose now infinite prime \( p \in \mathbb{N}_\infty \) such that
\[
\{ p > \max (|a_i|, b_N, |b_i|) \}. \tag{5.9}
\]

2. Using Robinson transfer principle from Equation (5.6) and Equation (4.19) one obtains directly
\[
\forall r (r \in \mathbb{N}) : \Xi (N, p, r) = \sum_{i=1}^{r} \left( \sum_{k=1}^{b_i} \left( M_{i,j} (N, p) \right) \right) = p^C, \in \mathbb{Z}_a. \tag{5.10}
\]
and therefore
\[
\forall r (r \in \mathbb{N}) : p^C \Xi (N, p, r). \tag{5.11}
\]

3. Using Robinson transfer principle from Equation (5.7) and Equation (4.21) one obtains directly
\[
\left| \xi_{k,l} (N, p) \right| = \left| \left( e^{\beta_{i,j}} \right) \int_{0}^{\infty} b^{N-i-p-1} z^{-1} f^p (z) \left[ e^{z} \right] dz \right| \leq \frac{1}{(p-1)!} \int_{0}^{\infty} b^{-1} f (z) \left[ e^{-z} \right] \left[ \left| b^{N-i-p-1} f^p (z) \right| \right] dz \leq \frac{\left[ g_0 (r) \right]}{(p-1)!} \leq \frac{\left[ g_0 (r) \right]}{(p-1)!}, \tag{5.12}
\]
where \( k = 1, \ldots, k_i, l = 1, \ldots, r \). Note that \( \forall \epsilon \in [0, \delta] \) there exists \( p = p (\epsilon) \)
\[
\left[ g_0 (r) \right] \leq \epsilon. \tag{5.13}
\]

4. From (5.13) follows that for any \( \epsilon \in [0, \delta] \) there exists an infinite prime \( p \in \mathbb{N}_\infty \) such that
\[
\forall r (r \in \mathbb{N}) : \sum_{i=1}^{r} \left( \sum_{k=1}^{b_i} \left( \xi_{k,l} (N, p) \right) \right) = \epsilon (p) < 1 \tag{5.14}
\]
where \( k = 1, \ldots, k_i, l = 1, \ldots, r \).

5. From Equation (5.5)-Equation (5.7) we obtain
\[
\left[ e^{\beta_{i,j}} \right] = \frac{M_{i,j} (N, p)}{M_0 (N, p)}, \tag{5.15}
\]
where \( k = 1, \ldots, k_i, l = 1, \ldots, r \).

Part II. The Wattenberg imbedding \( e^{\beta_{i,j}} \) into \( \mathbb{R}_d \)

1. By using Wattenberg imbedding \( \mathbb{R} \rightarrow \mathbb{R}_d \), and Gonshor transfer (see Subsection 2.8 Theorem 2.17) from Equation (5.8) one obtains
\[
\left( M_0 (N, p) \right)^{\mathbb{R}} = \left( b_N^{N-i-p-1} b_0^p \right)^{\mathbb{R}} + p^C = \left( b_N^{N-i-p-1} b_0^p \right)^{\mathbb{R}} + p^C \mathbb{R} \tag{5.16}
\]
where \( b_N b_0 \neq 0, C \in \mathbb{Z}_d \). We choose now an infinite prime \( p \in \mathbb{N}_\infty \) such that
\[
\left[ p^\beta \right] = \max (|a_i|, b_N, |b_i|). \tag{5.17}
\]

2. By using Wattenberg imbedding \( \mathbb{R} \rightarrow \mathbb{R}_d \), and Gonshor transfer from Equation (5.10) one obtains directly
\[
\forall r (r \in \mathbb{N}) : \left( \Xi (N, p, r) \right)^{\mathbb{R}} = \sum_{i=1}^{r} \left( \sum_{k=1}^{b_i} \left( M_{i,j} (N, p) \right) \right)^{\mathbb{R}} = p^C \in \mathbb{Z}_d \tag{5.18}
\]
and therefore
\[ \forall r \in \mathbb{N} \left[ \mathbf{p}^r \left( \left( \Xi(N, p, r) \right)^r \right) \right]. \]  
(5.19)

3. By using Wattenberg imbedding \( \mathbb{R} \to \mathbb{R}_g \) and Gonshor transfer from Equation (5.14) one obtains directly
\[ \forall r \in \mathbb{N} : \sum_{i=1}^{\mathbf{d}} \left( \left( \mathbf{a}_i^r \right)^r \sum_{j=1}^{\mathbf{d}} \left( \mathbf{e}_{ij}^r (N, p) \right)^r = e^r \left( \mathbf{p}^r \right) < 1. \]  
(5.20)

4. By using Wattenberg imbedding \( \mathbb{R} \to \mathbb{R}_g \) and Gonshor transfer from Equation (5.15) one obtains directly
\[ e^{\mathbf{r}_{ij}} \equiv \left( e^{\mathbf{r}_{ij}} \right)^r = \frac{\left( M_{ij}^r (N, p) \right)^r + e_{ij}^r (N, p)}{\left( M_0 (N, p) \right)^r}, \]  
(5.21)

where \( k = 1, \cdots, k_i, l = 1, \cdots, r \in \mathbb{N}. \)

Part III. Main equality

Remark 5.1. Note that in this subsection we often write for a short \( a^r \) instead \( \left( \mathbf{a}^r \right)^r, a \in \mathbb{R}. \) For example we write
\[ \forall r \in \mathbb{N} : e^{\mathbf{r}_{ij}} = \frac{M_{ij}^r (N, p)^r + e_{ij}^r (N, p)}{M_0^r (N, p)}, \]  
instead Equation (5.21).

Assumption 5.1. Let \( f_i(z), l = 1, 2, \cdots, \) be a polynomials with coefficients in \( \mathbb{Z}. \) Assume that for any \( l \in \mathbb{N} \) algebraic numbers over the field \( \mathbb{Q} : \beta_{ij}, \cdots, \beta_{i,j}, \quad k_i \geq 1, \quad l = 1, 2, \cdots \) form a complete set of the roots of \( f_i(z) \) such that
\[ f_i(z) \in \mathbb{Z}[z], \deg f_i(z) = k_i, l = 1, 2, \cdots \]  
(5.22)
\[ l = 1, 2, \cdots, a_0 \in \mathbb{Q}, a_0 \neq 0, r = 1, 2, \cdots. \]

Note that from Assumption 5.1 follows that algebraic numbers over the field \( \mathbb{Q}_d : \)
\[ \beta_{ij}^r \equiv \left( \mathbf{r}_{ij} \right)^r, \cdots, \beta_{i,j}^r \equiv \left( \mathbf{r}_{i,j} \right)^r, \quad k_i \geq 1, l = 1, 2, \cdots, \]  
for any \( l = 1, 2, \cdots, \) form a complete set of the roots of
\[ f_i^r (z) \equiv \left( f_i(z) \right)^r \in \mathbb{Z}_d [z], \deg f_i^r (z) = k_i, l = 1, 2, \cdots \]  
(5.23)

Assumption 5.2. We assume now that there exists a sequence
\[ \tilde{a}_l = \frac{q_l}{m_l} \in \mathbb{Q}, l = 1, 2, \cdots \]  
(5.24)
and rational number
\[ \tilde{a}_0 = \frac{q_0}{m_0} \in \mathbb{Q}, \]  
(5.25)
such that
\[ \sum_{i=1}^{\infty} \left| \tilde{a}_i \right| \sum_{j=1}^{\infty} \left| \mathbf{e}_{ij}^r \right| < \infty. \]  
(5.26)
and
\[ \tilde{a}_0 + \sum_{i=1}^{\infty} \tilde{a}_i \sum_{j=1}^{\infty} \mathbf{e}_{ij}^r = 0. \]  
(5.27)
Assumption 5.3. We assume now for a short but without loss of generality that the all numbers \( \beta_{i,j}, \ldots, \beta_{i,j} \), \( k_i \geq 1, l = 1, 2, \ldots \) are real.

In this subsection we obtain an reduction of the equality given by Equation (5.27) in \( \mathbb{R} \) to some equivalent equality given by Equation (3) in \( \mathbb{R}^d \). The main tool of such reduction that external countable sum defined in Subsection 2.8.

Lemma 5.1. Let \( \Delta_x (r) \) and \( \Delta_y (r) \) be the sum correspondingly
\[
\begin{align*}
\Delta_x (r) &= \bar{a}_0 + \sum_{i=1}^{\alpha_i} \sum_{k=1}^{\beta_{i,k}} e^r \beta_{i,k}, \\
\Delta_y (r) &= \sum_{j=1}^{\alpha_j} \sum_{k=1}^{\beta_{j,k}} e^r \beta_{j,k}.
\end{align*}
\]
(5.28)

Then \( \Delta_x (r) \neq 0, r = 1, 2, \ldots \)

Proof. Suppose there exists \( r \) such that \( \Delta_x (r) = 0 \). Then from Equation (5.27) follows \( \Delta_x (r) = 0 \). Therefore by Theorem 4.1 one obtains the contradiction.

Remark 5.2. Note that from Equation (5.27) follows that in generel case there is a sequence \( \{m_i\}_{i=1}^{\infty} \) such that
\[
\begin{align*}
\lim_{j \to \infty} m_i &= \infty, \quad \forall (i \in \mathbb{N}) \left[ \bar{a}_0 + \sum_{i=1}^{m_i} \sum_{k=1}^{k_i} e^r \beta_{i,k} < 0 \right], \\
\bar{a}_0 + \lim_{j \to \infty} \left( \sum_{i=1}^{m_i} \sum_{k=1}^{k_i} e^r \beta_{i,k} \right) &= 0,
\end{align*}
\]
(5.29)
or there is a sequence \( \{m_j\}_{j=1}^{\infty} \) such that
\[
\begin{align*}
\lim_{j \to \infty} m_j &= \infty, \quad \forall (j \in \mathbb{N}) \left[ \bar{a}_0 + \sum_{j=1}^{m_j} \sum_{k=1}^{k_j} e^r \beta_{j,k} > 0 \right], \\
\bar{a}_0 + \lim_{j \to \infty} \left( \sum_{j=1}^{m_j} \sum_{k=1}^{k_j} e^r \beta_{j,k} \right) &= 0,
\end{align*}
\]
(5.30)
or both sequences \( \{m_i\}_{i=1}^{\infty} \) and \( \{m_j\}_{j=1}^{\infty} \) with a property that is specified above exist.

Remark 5.3. We assume now for short but without loss of generelity that (5.29) is satisfied. Then from (5.29) by using Definition 2.17 and Theorem 2.14 (see Subsection 2.8) one obtains the equality [4]
\[
\left( \bar{a}_0 \right)^r + \left[ \#Ext \sum_{i \in \mathbb{N}} \left( \bar{a}_i \right)^r \sum_{k=1}^{\beta_{i,k}} e^r \beta_{i,k} \right] = -\varepsilon_d.
\]
(5.31)

Remark 5.4. Let \( \Delta^x (r) \) and \( \Delta^y (r) \) be the upper external sum defined by
\[
\begin{align*}
\Delta^x (r) &= \bar{a}_0 + \sum_{i=1}^{\alpha_i} \sum_{k=1}^{\beta_{i,k}} e^r \beta_{i,k}, \\
\Delta^y (r) &= \#Ext \sum_{i \in \mathbb{N}} \left( \bar{a}_i \right)^r \sum_{k=1}^{\beta_{i,k}} e^r \beta_{i,k}.
\end{align*}
\]
(5.32)

Note that from Equation (5.31)-Equation (5.32) follows that
\[
\Delta^x (r) + \Delta^y (r) = -\varepsilon_d.
\]
(5.33)

Remark 5.5. Assume that \( \alpha, \beta \in \mathbb{R}^d \) and \( \beta \notin \mathbb{R} \). In this subsection we will write for a short \( ab \left[ \alpha | \beta \right] \) iff \( \beta \) absorbs \( \alpha \), i.e. \( \beta + \alpha = \beta \).

Lemma 5.2. \( -ab \left[ \Delta^x (r) \Delta^y (r) \right], r = 1, 2, \ldots \)
Proof. Suppose there exists \( r \in \mathbb{N} \) such that \( \Delta^x_q (r) \Delta^x_q (r) \). Then from Equation (5.33) one obtains

\[
\Delta^x_q (r) = -e_a. \tag{5.34}
\]

From Equation (5.34) by Theorem 2.11 follows that \( \Delta_q (r) = 0 \) and therefore by Lemma 5.1 one obtains the contradiction.

Theorem 5.2. [4] The equality (5.31) is inconsistent.

Proof. Let us considered hypernatural number \( \mathfrak{I} \in *\mathbb{N}_+ \) defined by countable sequence

\[
\mathfrak{I} = (m_0, m_0 \times m_1, \ldots, m_0 \times m_1 \times \cdots \times m_n, \ldots) \tag{5.35}
\]

From Equation (5.31) and Equation (5.35) one obtains

\[
\mathfrak{I}^x \times (\mathfrak{I}^x a_0)^x + \mathfrak{I}^x \times \left[ \mathfrak{I}^x \times \sum_{i=1}^{l_i} (\mathfrak{I}^x a_i)^x \right] = \mathfrak{I}^x_0 + \left[ \mathfrak{I}^x \times \sum_{k=1}^{i_k} (\mathfrak{I}^x \alpha k_j)^x \right] = -\mathfrak{I}^x \times e_a \tag{5.36}
\]

where

\[
\mathfrak{I}^x_0 = \mathfrak{I}^x a_0 \frac{\mathfrak{I}^x g_0}{m_0},
\]

\[
\mathfrak{I}^x_i = \mathfrak{I}^x a_i \frac{\mathfrak{I}^x g_i}{m_i}. \tag{5.37}
\]

Remark 5.6. Note that from inequality (5.12) by Gonshor transfer one obtains

\[
\left| e_{\lambda_j} (N, p)^x \right| \leq \left| \mathfrak{I}^x g_0 \left( r \right)^x \right| \frac{\mathfrak{I}^x g_j \left( r \right)^x}{(p^x - 1)^x} \quad \text{,} \quad N, p \in *\mathbb{N}_+. \tag{5.38}
\]

Substitution Equation (5.21) into Equation (5.36) gives

\[
\mathfrak{I}^x_0 + \mathfrak{I}^x \sum_{i=1}^{l_i} \sum_{k=1}^{i_k} M_{\alpha k_j}^x (N, p)^x + e_{\lambda_j}^x (N, p) = -\mathfrak{I}^x \times e_a. \tag{5.39}
\]

Multiplying Equation (5.39) by Wattenberg hyperinteger \( [\mathfrak{I}^x M_0 (N, p)]^x = \mathfrak{I}^x_0 \) by Theorem 2.13 (see subsection 2.8) we obtain

\[
\mathfrak{I}^x_0 \times M_0^x (N, p) + \mathfrak{I}^x \sum_{i=1}^{l_i} \sum_{k=1}^{i_k} M_{\alpha k_j}^x (N, p)^x + e_{\lambda_j}^x (N, p) = -\mathfrak{I}^x \times [\mathfrak{I}^x M_0 (N, p)]^x \times e_a. \tag{5.40}
\]

By using inequality (5.38) for a given \( \delta \in \mathbb{R} \), \( \delta \approx 0 \) we will choose infinite prime integer \( p \in *\mathbb{N}_+, p = p(\delta) \) such that

\[
\mathfrak{I}^x \sum_{i=1}^{l_i} \sum_{k=1}^{i_k} e_{\lambda_j}^x (N, p) \leq -\delta^x \times e_a. \tag{5.41}
\]

Therefore from Equations (5.40) and (5.41) by using definition (2.15) of the function \( \text{Int}_p (\alpha) \) given by Equation (2.20)-Equation (2.21) and corresponding basic property \( I \) (see Subsection 2.7) of the function \( \text{Int}_p (\alpha) \) we obtain

\[
\text{Int}_p \left( \mathfrak{I}^x_0 \times M_0^x (N, p) + \mathfrak{I}^x \sum_{i=1}^{l_i} \sum_{k=1}^{i_k} M_{\alpha k_j}^x (N, p)^x + e_{\lambda_j}^x (N, p) \right) = \mathfrak{I}^x_0 \times M_0^x (N, p) + \mathfrak{I}^x \sum_{i=1}^{l_i} \sum_{k=1}^{i_k} M_{\alpha k_j}^x (N, p)
\]

\[
= -\text{Int}_p \left( \mathfrak{I}^x \times [\mathfrak{I}^x M_0 (N, p)]^x \times e_a \right) = -\mathfrak{I}^x \times [\mathfrak{I}^x M_0 (N, p)]^x \times e_a. \tag{5.42}
\]

From Equation (5.42) finally we obtain the main equality
We will choose now infinite prime integer $p$ in Equation (3.56) $p = \hat{p} \in \mathbb{N}_\infty$ such that
$$\hat{p}^\varepsilon > \max\left(\left|b_0^\varepsilon\right|, \left|b_N^\varepsilon\right|, \left|\mathfrak{I}^\varepsilon\right|\right).$$

Hence from Equation (5.16) follows
$$\hat{p}^\varepsilon \uparrow \mathcal{M}^\varepsilon (N, \hat{p}).$$

Note that $\left[\ast M_o (n, \hat{p})\right]^\varepsilon \neq 0^\varepsilon$. Using (5.44) and (5.45) one obtains:
$$\hat{p}^\varepsilon \uparrow \mathcal{M}^\varepsilon (N, \hat{p}, r) \times \mathfrak{I}^\varepsilon.$$  

Using Equation (5.11) one obtains
$$\hat{p}^\varepsilon \uparrow \mathcal{M}^\varepsilon (N, \hat{p}), k, l = 1, 2, \cdots. \tag{5.46}$$

**Part IV. The proof of the inconsistency of the main equality (5.43)**

In this subsection we will prove that main equality (5.43) is inconsistent. This proof is based on the Theorem 2.10 (v), see Subsection 2.6.

**Lemma 5.3.** The equality (5.43) under conditions (5.46)-(5.47) is inconsistent.

**Proof.** (I) Let us rewrite Equation (5.43) in the short form
$$\Gamma (N, \hat{p}) + \Sigma^\varepsilon (N, \hat{p}) = -\Lambda^\varepsilon (\hat{p}) \times \mathfrak{I}_0,$$  

where
$$\begin{aligned}
\Sigma^\varepsilon (N, \hat{p}) &= \#\text{Ext} \sum_{l=0}^{k_1} \sum_{j=1}^{k_2} \sum_{l=1}^{k_3} \mathfrak{I}^\varepsilon \times \mathcal{M}^\varepsilon (N, p), \\
\Gamma (n, \hat{p}) &= \mathfrak{I}^\varepsilon \times \left[\ast M_o (N, \hat{p})\right]^\varepsilon, \Lambda^\varepsilon (\hat{p}) = \mathfrak{I}^\varepsilon \times \left[\ast M_o (N, \hat{p})\right]^\varepsilon.
\end{aligned} \tag{5.49}$$

From (5.46)-(5.47) follows that
$$\begin{aligned}
\hat{p}^\varepsilon \uparrow \Gamma (N, \hat{p}), \\
\hat{p}^\varepsilon \uparrow \Sigma^\varepsilon (N, \hat{p}).
\end{aligned} \tag{5.50}$$

**Remark 5.7.** Note that $\Sigma^\varepsilon (N, \hat{p}) \notin \mathbb{R}^\varepsilon$. Otherwise we obtain that
$$\text{ab} \cdot \text{p} \left(\Gamma (N, \hat{p}) + \Sigma^\varepsilon (N, \hat{p})\right) = \emptyset. \tag{5.51}$$

But the other hand from Equation (5.48) follows that
$$\text{ab} \cdot \text{p} \left(\Gamma (N, \hat{p}) + \Sigma^\varepsilon (N, \hat{p})\right) = -\Lambda^\varepsilon (\hat{p}) \times \mathfrak{I}_0. \tag{5.52}$$

But this is a contradiction. This contradiction completed the proof of the statement (I).

(II) Let $\tilde{\Lambda}^\varepsilon (k, N, \hat{p}), \tilde{\Lambda}^\varepsilon (k, N, \hat{p}), \tilde{\Lambda}^\varepsilon (k, k, N, \hat{p})$ and $\tilde{\Lambda}^\varepsilon (k, N, \hat{p}, \varepsilon^\varepsilon), \tilde{\Lambda}^\varepsilon (k, N, \hat{p}, \varepsilon^\varepsilon)$ be the external sum correspondingly
$$\begin{aligned}
\tilde{\Lambda}^\varepsilon (r, N, \hat{p}) &= \Gamma (N, \hat{p}) + \sum_{l=1}^{k_1} \sum_{j=1}^{k_2} \sum_{l=1}^{k_3} \mathfrak{I}^\varepsilon \times \mathcal{M}^\varepsilon (N, p), \\
\tilde{\Lambda}^\varepsilon (r, N, \hat{p}) &= \sum_{l=1}^{k_1} \sum_{j=1}^{k_2} \sum_{l=1}^{k_3} \mathfrak{I}^\varepsilon \times \mathcal{M}^\varepsilon (N, p), \\
\tilde{\Lambda}^\varepsilon (r_1, r_2, N, \hat{p}) &= \sum_{l=1}^{k_1} \sum_{j=1}^{k_2} \sum_{l=1}^{k_3} \mathfrak{I}^\varepsilon \times \mathcal{M}^\varepsilon (N, p), \tag{5.53}
\end{aligned}$$

\begin{align}
\tilde{\Lambda}^\varepsilon (r, N, \hat{p}, \varepsilon^\varepsilon) &= \Gamma (N, \hat{p}) + \sum_{l=1}^{k_1} \sum_{j=1}^{k_2} \mathfrak{I}^\varepsilon \times \mathcal{M}^\varepsilon (N, p) + \varepsilon^\varepsilon (N, p), \\
\tilde{\Lambda}^\varepsilon (r, N, \hat{p}, \varepsilon^\varepsilon) &= \#\text{Ext} \sum_{l=1}^{k_1} \sum_{j=1}^{k_2} \mathfrak{I}^\varepsilon \times \mathcal{M}^\varepsilon (N, p) + \varepsilon^\varepsilon (N, p). \tag{5.53}
\end{align}
Note that from Equation (5.43) and Equation (5.53) follows that
\[ \hat{\Delta}_x^e (r, N, \hat{p}) + \hat{\Delta}_x^e (r, N, \hat{p}) = -\Lambda^e (\hat{p}) \times \epsilon_a, \quad r = 1, 2, \ldots \] (5.54)

**Lemma 5.4.** Under conditions (5.46)-(5.47)
\[ -ab \left[ \hat{\Delta}_x^e (r, N, \hat{p}, \epsilon_{x,j}^e) \right] \hat{\Delta}_x^e (r, N, \hat{p}, \epsilon_{x,j}^e), r = 1, 2, \ldots \] (5.55)
and
\[ -ab \left[ \hat{\Delta}_x^e (r, N, \hat{p}) \right] \hat{\Delta}_x^e (r, N, \hat{p}), r = 1, 2, \ldots \] (5.56)

**Proof.** First note that under conditions (5.46)-(5.47) one obtains
\[ -e_a \left[ \Lambda^e (\hat{p}) \right] \hat{\Delta}_x^e (r, N, \hat{p}, \epsilon_{x,j}^e) = -\Lambda^e (\hat{p}) \times \epsilon_a. \] (5.58)
From Equation (5.58) by Theorem 2.17 one obtains
\[ -e_a = \left[ \Lambda^e (\hat{p}) \right] \hat{\Delta}_x^e (r, N, \hat{p}, \epsilon_{x,j}^e) = \left[ \Lambda^e (\hat{p}) \right] \hat{\Delta}_x^e (r, N, \hat{p}, \epsilon_{x,j}^e). \] (5.59)
Thus
\[ -e_a = \Delta_x^e (r, N, \hat{p}, \epsilon_{x,j}^e). \] (5.60)
From Equation (5.60) by Theorem 2.11 follows that \( \Delta_x (r) = 0 \), and therefore by Lemma 5.2 one obtains the contradiction. This contradiction finalized the proof of the Lemma 5.4.

(III)

**Remark 5.8.** (i) Note that from Equation (5.49) by Theorem 2.10 (v) follows that \( \Sigma^\wedge (N, \hat{p}) \) has the form
\[ \Sigma^\wedge (N, \hat{p}) = q^e + ab \cdot p \left[ \Sigma^\wedge (N, \hat{p}) \right] = q^e + \left( -\Lambda^e (\hat{p}) \times \epsilon_a \right) \] (5.61)
where
\[ q^e \in \Sigma^\wedge (N, \hat{p}) = \Delta_x^e (1, N, \hat{p}), \quad q \in \mathbb{Z}_m \text{ and } \hat{p} | q. \] (5.62)
(ii) Substitution by Equation (5.61) into Equation (5.48) gives
\[ \Gamma (N, \hat{p}) + \Sigma^\wedge (N, \hat{p}) = \Gamma (N, \hat{p}) + q^e + \left( -\Lambda^e (\hat{p}) \times \epsilon_a \right) = -\Lambda^e (\hat{p}) \times \epsilon_a. \] (5.63)

**Remark 5.9.** Note that from (5.63) by definitions follows that
\[ ab \left[ \left( \Gamma (N, \hat{p}) + q^e \right) \right] = -\Lambda^e (\hat{p}) \times \epsilon_a. \] (5.64)

**Remark 5.10.** Note that from (5.62) by construction of the Wattenberg integer \( \Sigma^\wedge (N, \hat{p}) \) obviously follows that there exists some \( r_1, r_2 \in \mathbb{Z}^+ \) such that
\[ \tilde{\Delta}_x^e (1, r_1, N, \hat{p}) \leq q^e \leq \tilde{\Delta}_x^e (1, r_2, N, \hat{p}), \quad r_1 < r_2. \] (5.65)
Therefore
\[ \Gamma (N, \hat{p}) + \tilde{\Delta}_x^e (1, r_1, N, \hat{p}) \leq \Gamma (N, \hat{p}) + q^e \leq \Gamma (N, \hat{p}) + \tilde{\Delta}_x^e (1, r_2, N, \hat{p}). \] (5.66)
Note that under conditions (5.46)-(5.47) and (5.66) obviously one obtains
\[ 0 = \Gamma (N, \hat{p}) + \tilde{\Delta}_x^e (1, r_1, N, \hat{p}) \leq \Gamma (N, \hat{p}) + q^e \leq \Gamma (N, \hat{p}) + \tilde{\Delta}_x^e (1, r_2, N, \hat{p}) \leq 0, \quad \Gamma (N, \hat{p}) + q^e = 0. \] (5.67)
From Equation (5.63) follows that
\[ \Gamma(N, \hat{p}) + q^* + \left( -\Lambda^* (\hat{p}) \times e_a \right) = -\Lambda^* (\hat{p}) \times e_a. \] (5.68)

Therefore
\[ \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] + (-e_a) = -e_a. \] (5.69)

From (5.69) follows that
\[ 0 \neq \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + \Delta_e^* (1, r_N, \hat{p}) \right] < \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] \]
\[ \leq \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + \Delta_e^* (1, r_N, \hat{p}) \right] \leq 0, \] (5.70)
\[ \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] \leq 0. \]

Note that from (5.70) by Theorem 2.8 (see Subsection 2.5) and Formula (5.32) one obtains
\[ 0 \neq \text{Wst} \left( \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + \Delta_e^* (1, r_N, \hat{p}) \right] \right) = \text{Wst} \left( (*a_0)^g + \Delta_e^* (1, r_N, \hat{p}) \right), \]
\[ \text{Wst} \left( \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + \Delta_e^* (1, N, \hat{p}) \right] \right) = \text{Wst} \left( (*a_0)^g + \Delta_e^* (1, r_N, \hat{p}) \right) \leq 0, \] (5.71)
\[ \text{Wst} \left( \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] \right) = 0. \]

From Equation (5.70)-Equation (5.71) follows that
\[ 0 \neq \text{Wst} \left( (*a_0)^g + \Delta_e^* (1, r_N, \hat{p}) \right) < \text{Wst} \left( \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] \right) \]
\[ \leq \text{Wst} \left( (*a_0)^g + \Delta_e^* (1, r_N, \hat{p}) \right) \leq 0, \] (5.72)
\[ \text{Wst} \left( \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] \right) \leq 0. \]

Thus
\[ -ab \left[ \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] \right] (-e_a) \] (5.73)
and therefore
\[ \left( \Lambda^* (\hat{p}) \right)^{-1} \left[ \Gamma(N, \hat{p}) + q^* \right] + (-e_a) \neq -e_a. \] (5.74)

But this is a contradiction. This contradiction completed the proof of the Lemma 5.3.

**Remark 5.11.** Note that by Definition 2.18 and Theorem 2.18 from Assumption 5.1 and Assumption 5.2 follows
\[ \left( a_0 \right)^g + \sum_{i=1}^{\#Ext} \left( a_0 \right)^g \sum_{k=1}^{e} \left( e^{-p_i} \right)^g = -e_a = e_a \]

**Theorem 5.3.** The equality (5.75) is inconsistent.

**Proof.** The proof of the Theorem 5.3 obviously copies in main details the proof of the Theorem 5.3.

Theorem 5.3 completed the proof of the main Theorem 1.6.
