Received October 27th, 2011; revised November 19th, 2011; accepted December 5th, 2011

The article studies the problems of improving the degree of information security in the distance learning systems (DLS) at the expense of using innovative methods and technologies of information security systems (ISS). In this article are also considered the recommendations for improving existing DLS in training of the specialists at higher educational institutions as per Bologna Process regulations. In addition, this article demonstrates the results of statistical researches in the field of information and economic security for DLS. The types of expenses in the DLS are also classified here. The authors have proposed the key elements for the DLS, the use of which is shown in the example of a research portal of information and economic security. The arguments presented will increase the level of security. The results of analysis, carried out within this article, demonstrate the real possibility of development and further implementation of security elements.

Keywords: Distance Learning Systems; DLS; Security; Safety; Distance Education; Information Security Systems

Introduction

As it is known (Daniel, 1996), the area of distance (electronic) education (DE) cannot spare without the mutual influence of all related sectors and aspects of the operation; however, this statement can be applied to other areas. In addition, the solution of many global problems of DE, which is currently experiencing a certain crisis, is directly linked to the development of distance learning systems (DLS), based on information and communication technologies. The traditional system of DE with its restricted access to universities, with relatively high cost and inflexibility is unable to cope with growing demand for higher education and unable to provide equal access to education for the general population.

What is DLS? Distance education (DE) or distance learning (DL) is a field of education that focuses on teaching methods and technology with the purpose of delivering teaching, often on an individual basis, to students who are not physically present in a traditional educational setting such as classroom. It is described as “a process of creating and providing access to learning when the source of information and the learners are separated by time and distance, or both” (Honeyman & Miller, 1991). Distance education courses that require physical on-site presence for any reason (including taking examinations), are considered as hybrid (Tabor, 2007) or blended courses of study.

Problem of DE were discussed in studies of various scientists. In their opinion, the implementation of DE into the process of training and retraining of specialists in the educational system of different countries is necessary due to several reasons:

- Slow mutual integration and implementation of European and world standards in education and research activity with regard to the principles of the Bologna process.
- Intensity of science development requires permanent improvement of the professional knowledge and skills of employees of different specialities.
- Only technology is capable of providing timely corrective training content by high-speed update of knowledge in information-educational environment.
- High economic efficiency of DE.

Issues associated with theoretical and practical aspects of implementation of distance learning technologies which are deployed in modern education, are discussed in the works (Casey & Lorenzen, 2010; Dickey, 2005). Modern technologies and methods of teaching, learning and knowledge control are comprehensively considered in the works (Levinson, Moore, & Kearsley, 2005).

In addition, the relevance of this question is that the implementation of DLS with their innovative methods of education can facilitate the solution of major social problems in the following ways:

- Implementation of the population’s needs for educational services.
- Satisfaction of the country’s needs in quality of trained specialists.
- Increase of social and professional mobility of students, their social activity, level of self-consciousness, expanding of their mental outlook.
- Preservation and increase of knowledge, human and material potentials, accumulation of national higher education.
- Development of unified education space within the country and the entire international community, which suggests the possibility to get education in any place of educational space.

Statistical Information

In order to emphasize the relevance of research of DE, a number of indicators (educational, social and economic) are consid-
ered below. As it is known (Daniel, Kanwar, & Uvalić-Trumbić, 2005), DLS are based on the following key resources: users and development of the means (channels) of access (Figure 1).

For example, as it is shown, Ukraine was on the 9th place among the countries of Euro-region with the index of population of 33.9%, i.e. at least every third person here knows what is the Internet and can use it.

According to the result at Figure 1 it is possible to make an inference that presented distribution completely corresponds to the share of users (at 30 of July, 2011) in Europe. It based on population of each country from which this distribution has a direct relationship.

Thus the level of growth of this knowledge in Ukraine is over 7500% per year (UNESCO Institute for Statistics, 2006).

In terms of Internet penetration, the distribution of the regions is shown on Figure 2.

The presented results reflect the real (at 31 of March, 2011) state of education in the world and by region, which shows that education level partly depends on economic situation of the region, population and other factors, but its require additional research.

This indicator is more objective, because it shows the proportion of the Internet use among the entire population of the region.

Obtained statistical data can be used to conduct a comprehensive analysis of the structure of existing DLS, detection of vulnerabilities in them and threats of unauthorized access, implemented through the existing vulnerabilities, for proposing a model of the information security system, and formulation of conceptual recommendations for modifications (improvements) of DLS.

As for the equity participation of actors in DLS, the statistics provides (Kavun, 2011) the following data (Figure 3).

Economic indicators in DLS must not be equal for the student and tutor (Bosseler and Carbonneau, 2009), taking into account the presence of fixed and variable costs. These are mainly financial (Kavun, 2007) costs (Table 1).

Thus, DLS can be represented in the form (Karpenko, 2008) of the scheme taking into account the cyclical nature of the study (Figure 4).

Then, considering the security aspects (Ponomarenko and Kavun, 2008), that are directly relevant to DLS, it is necessary to identify major elements of them (or subsystems-services), which the student would face with (Figure 5).

They are based on items considered by student representatives. The results of the survey of university students in Chicago are demonstrated on Figure 6.

The research, which was conducted by the Center of Public Opinion Research NORC at the University of Chicago 10 years after the tragic event of 11 of September, 2001 showed the depressing result.

It should be noted that Americans trust the information about different aspects of their private life only to governmental entities.

Gathering of such information by private companies evokes protest from USA citizens; it will be enough to remember precedents with mobile devices running by iOS and Windows Phone.

Owners of these devices expressed their protest and it led to legal action.

Nevertheless, in the Register edition was written that only one in five respondents believe that USA now is moving in the right direction.

Among the factors considered a special place is occupied by the following ones: authentication, identity, website and communication tools (FTP and e-mail services) (National initiative for cyber security education, 2011). All of them in aggregate or individually promote the use of passwords, personal information, content, and copyright compliance. At the same time in the past these factors were subjected by negative impact from substitution, loss, alteration, falsification and other negative aspects of information security (Hoover, 2010). Figure 7 demonstrates students’ attitudes towards the Internet.

Figure 5.
Influence of security factors on the DLS (Kavun, 2009).

Figure 6.
Results of polling of US citizens at the University of Chicago (according to NORC, September 2011).

1: positive attitude towards the government to read personal mail without permission; 2: positive attitude to reading the data when it is necessary to communicate with foreigners; 3: thinking, that government must be able to browse someone’s search history without judicial authorization; 4: financial records can also be inspected without proper notice; 5: positive attitude towards the government’s listening to personal phone calls; 6: positive attitude towards the government’s listening to personal phone if calls are directed abroad; 7: approval of video surveillance in public places; 8: approval of video surveillance in public places, if respondents have children; 9: consideration a torture of people, suspected of terrorism, to be a norm; 10: approval of “harsh interrogation measures” on people, suspected of terrorism; 11: consideration a torture to be illegal; 12: thinking, that US is now on the right way.
The importance of the Internet connection is only one of many discoveries of the Cisco last annual report, which were conducted in May - June 2011. There were a lot of respondents from 14 countries took part in the series of interviews including USA, Canada, Mexico, Brazil, The Great Britain, France, Spain, Germany, Italy, Russian Federation, India, China, Japan and Australia.

More statistics concerning this learning area is presented at the author’s website (Kavun, 2011).

Aspects of Information Security

DL is based on the use of traditional and innovative teaching methods and tools that are based on information and telecommunication technologies and provide an interactive learning process participants interaction and obtain, study and control of learning.

Authors performed the analysis possible to implement decomposition of the learning process cycle (Figure 8).

For the traditional education system common sources of learning are only printed materials, while innovative education involves the use of both printed and audio-visual materials, computer teaching programs, electronic journals, online databases, and other educational materials provided to the listener through computer networks. Therefore, this study raises the problem of prediction of organizational and technical means of safe and confidential storage, usage and transfer of data through these networks.

Based on the author’s analysis (Figure 8) of the educational process in the DLS, we found these main threats: disclosure, integrity and denial of service. Additions were formed from characteristics and examples of possible attacks that can be implemented (Table 2).

Figure 7.
Results of the poll 1441 College Students (aged 18 - 24) and 1412 Employees (21 - 29) that completed an online survey (according to Cisco, May - June 2011).

Figure 8.
The scheme of the cycle of educational process in the DLS.
ISS is part of the overall management system, based on risk analysis and is intended for the design, implementation, monitoring, and maintenance and improvement action in the field of information security (Ponomarenko and Kavun, 2008). The main purpose of any ISS is to ensure sustainable operation of the facility, prevention of threats to its security, protection from unlawful acts, to prevent disclosure, loss, leakage, modification and destruction service information, ensure the normal functioning of all departments of the object. Examples of such countermeasures are also designed to be the authors (Table 3).

The authors describe a generalized scheme of constructing the ISS-model (Figure 9) that meets international standards:

In order to take into consideration all possible aspects of information and economic security, we should highlight the key elements that influence the development of the DLS.

Via the example of a research portal of information and economic security (Kavun, 2011), the authors offer the following key elements for distance learning systems (Figure 10):

1) Use of intelligent hosting;
2) Means of protection from copyright;
3) Statistical data binding;
4) Use of personal unique logo;
5) Implementation of watermarking technology;
6) Use of authentication and authorization;

![Figure 9](image1.png)

Figure 9. The common scheme to building of ISS-model.

![Figure 10](image2.png)

Figure 10. Key elements for distance learning systems.
7) Confirmation of content validity;
8) Implementation of micro printed and CAPTCHA technologies.

All disputes or created by the negative aspects of information security (Rezgui, 2007) entail the emergence of aspects of economic security, which together form the financial (monetary) loss. This is confirmed by the following numbers according to data 2010-2011: the numbers of stolen records of personal data—$3.9 million per year; increase in the number of incidents—1.5 - 2 times per year; costs for the organization to support the information and economic security—127 hours per month; proportion of organizations having problems using the password—90% (Kavun, 2011).

What is the financial side of safety? For example, we present a few numbers that characterize this side. Hacking website or forum costs only $50 (at a cost to build $300 - $5000). The question immediately arises, “Is it worth then to spend money on creating a website?” The cost of a single account—$20 - $25 (considering the total amount of $80 million per year, it’s the market earning crackers). Spam mailing costs from 50 up to $ 200, depending on the volume of distribution. But this is the cheapest way of public relations, advertising, which can lead to the collapse of a marketing plan for the enterprises or other organizations. Breaking the mailbox costs from $15 to $50, and this can be everyone’s mailbox. At the same time other statistics show that about 45% of the information in the category of trade secret is transmitted by e-mail (Kavun, 2011).

To prevent these threats of unauthorized access, which is defined as access to information that is in violation of established rules of access permissions in the automated system, a necessary condition for a modification of DLS aiming at the improvement the level of information security (Kavun, 2007). Such improvement is possible when using the ISS. ISO/IEC 15408 “Information technology—Security techniques—evaluation criteria of information security,” and the ISO/IEC 17799 “Information security management,” and takes into consideration trends in the regulatory framework for information security.

Therefore, because the DLS revealed several threats of unauthorized access, it should form and hold complex of means and measures (countermeasures) that would have eliminated all points of risk threats implementation.

Thus, the influence aspects of information and economic security development on DLS become obvious.

The use of watermarking technology in conjunction with the micro text will uniquely identify the authorship of content, therefore, will help to protect copyrights. Tools of WEB-validation confirm the stability of the code, the absence of malicious content, which ultimately leads to an increase of the credibility of the submitted materials, increases the rating and increases revenue. Authorization prevents from third-party developers claim or simply swindlers on the authorship, sue. Technology CAPTCHA (e.g., graphic interpretation) eliminates the effects of but autodialers, thus ensuring the objectivity of the statistics show, the audience and increase the degree of confidence. A reasonable hosting involves correct and optimal choice of provider (host) and provides the complex of the resources and technologies, which lead to an increase of population density, increase of functionality, increase of obtaining and providing opportunities.

Conclusion

Thus, the introduction and use of the above key elements will be deleted and if not protected, and then at least significantly reduce the impact of the consequences of negative impacts in the areas of information and economic security:

1) Receive (or adjust) the value of content (such as for resale, we can give you an example from the Facebook): the copyrighting is widely developed nowadays. In many countries for copyrighting no punishment or fine are provided for. Besides, it is very difficult to see and prove the commission of this act. It all cause significant damage to the owners of educational resources, although most of the material have a public access.

2) Protect their copyrights (intellectual) rights: also it is a difficult question, which requires deep knowledge of international legal rights and results of litigation of violations and what is the most important, compensation for violation in copyright protection. In this aspect knowledge of the information will significantly facilitate the possible consequences based on results of trials in copyright confirmation.

3) Can enter the world market (the same example with Facebook, if you remember how it all began): such an achievement will have a positive influence on the company image, profit and rating; extend sphere of influence in their territory of activity. Besides, entering the global market is a natural desire (and international recognition) of any enterprises, including educational institutions.

4) Increase the ratings of educational institutions (due to the implementation of instructions of Ukrainian President to join the world rankings): for university to be in the rating (at the high position) has always a positive influence on the rating and the image of the university, providing the increasing of applicants number (due to the bigger importance and prestige), raising the status as a participant of different project, increasing the degree of belief and recognition of domestic and foreign universities.

5) Protect personal data and to ensure existing regulations: current state of users’ personal data protection or other subject of educational activity entities requires providing a sufficient attention, the necessary funds and resources for preventing their leak (substitution, unauthorized access or other negative impact). Otherwise university takes a risk of significantly reducing their image or rate or to stop the existence.

6) Jointly raise the level of e-learning: as a result of the introduction and use of the above recommendations will increase the level of e-learning, put this form of training together with other forms to the appropriate location, and provide further practical use.

7) Establish a system of (complex) multimedia teaching systems, which will compete in the global market: the use of such system is a requirement of the modern world; because the technological development makes to implement various multimedia technologies to help the learning process goes to a new, higher level. In addition, they make possible the increasing of distance education level if general, to facilitate its use and, thus, attract more participants into the education process. Modern multimedia technologies allow to present material to study more clearly and simply and moreover they can make the process dynamic.

Thus, distance education, which becomes obvious reality in the modern world and in the near future will develop most rapidly, because only through economic and technological advantages of this model can be satisfied with a huge demand for higher education, expected in developing countries. The optimal way of this development is creation of DLS, which based on
information and communication technologies (Romanenko, Stolbov and Kalachova, 2009), with a guarantee of qualifying education, effective student support and an appropriate level of information security, which can be achieved by integrating the ISS into DLS.
