Abstract

In this paper, we introduce the notion of intuitionistic fuzzy $\alpha$-generalized closed sets in intuitionistic fuzzy minimal structure spaces and investigate some of their properties. Further, we introduce and study the concept of intuitionistic fuzzy $\alpha$-generalized minimal continuous functions.

Keywords

Intuitionistic Fuzzy Topology, Intuitionistic Fuzzy $\alpha$-Generalized Closed Set, Intuitionistic Fuzzy $\alpha$-Generalized Continuous Function, Intuitionistic Fuzzy $\alpha$-Generalized Continuous Mappings

1. Introduction

The concept of fuzzy sets was introduced by Zadeh [1] and later Atanassov [2] generalized this idea to intuitionistic fuzzy sets. Coker [3] introduced the notion of intuitionistic fuzzy topological space and other related concepts. The concept of minimal open set has been introduced by Nakaoka and Oda [4] in 2001. The concept of intuitionistic fuzzy generalized minimal open set has been introduced by Bhattacharya et al. [5] in 2008. Intuitionistic fuzzy $\alpha$-generalized closed sets and its properties in intuitionistic fuzzy topology was introduced and studied in [6] [7]. Recently, some results on intuitionistic fuzzy generalized minimal closed sets were introduced by Bhattacharya [8] in 2010. In this paper, we introduce the notion of intuitionistic fuzzy $\alpha$-generalized closed sets and intuitionistic fuzzy $\alpha$-generalized* closed sets in intuitionistic fuzzy topological spaces and investigate some of their properties. Further, we introduce and study the concept of intuitionistic fuzzy $\alpha$-generalized minimal continuous functions.

2. Preliminaries

Throughout this paper, by $(X, \tau)$ or simply by $X$ we will denote the Coker’s intuitionistic fuzzy topological space.
(briefly, IFTS). For a subset \( A \) of a space \((X, \tau)\), \( cl(A) \), \( int(A) \) and \( \overline{A} \) denote the closure of \( A \), the interior of \( A \) and the complement of \( A \) respectively. Each intuitionistic fuzzy set (briefly, IFS) which belongs to \((X, \tau)\) is called an intuitionistic fuzzy minimal open set (briefly, IFMOS) in \( X \). The complement of \( A \) of an IFMOS \( A \) in \( X \) is called an intuitionistic fuzzy minimal closed set (briefly, IFMCS) in \( X \).

We introduce some basic notions and results that are used in the sequel.

Definition 2.1. [3] A subset \( A \) of a family \( \tau \) of IF sets on \( X \) is called an IF minimal open set in \( X \) if an IF open set which is contained in \( A \) is either \( 0 \) or \( A \).

Definition 2.2. [3] An IF set is said to be an IF Maximal open set of IFTS \((X, \tau)\) if and only if it is not contained in any other open set of \( \tau \).

Definition 2.3. [9] Let \( X \) be a nonempty fixed set and \( I \) be the closed interval \([0, 1]\). An intuitionistic fuzzy set (IFS) \( A \) is an object of the following form \( A=\{ (x, \mu_{A}(x), \nu_{A}(x)) : x \in X \} \), where the mappings \( \mu_{A}: X \rightarrow I \) and \( \nu_{A}: X \rightarrow I \) denote the degree of membership (namely \( \mu_{A}(x) \)) and the degree of non-membership (namely \( \nu_{A}(x) \)) for each element \( x \in X \) to the set \( A \), respectively, and \( 0 \leq \mu_{A}(x)+\nu_{A}(x) \leq 1 \) for each \( x \in X \).

 Obviously, every fuzzy set \( A \) on a nonempty set \( X \) is an IFS of the following form

\[ A=\{ (x, \mu_{A}(x), 1-\mu_{A}(x)) : x \in X \} . \]

Definition 2.4. [9] Let \( A \) and \( B \) be IFSs of the form \( A=\{ (x, \mu_{A}(x), \nu_{A}(x)) : x \in X \} \) and \( B=\{ (x, \mu_{B}(x), \nu_{B}(x)) : x \in X \} \). Then

1) \( A \subseteq B \) if and only if \( \mu_{B}(x) \leq \mu_{A}(x) \) and \( \nu_{B}(x) \geq \nu_{A}(x) \);

2) \( \overline{A} =\{ (x, \mu_{\overline{A}}(x), \mu_{A}(x)) : x \in X \} \);

3) \( A \cap B =\{ (x, \mu_{A}(x) \wedge \mu_{B}(x), \nu_{A}(x) \lor \nu_{B}(x)) : x \in X \} \);

4) \( A \cup B =\{ (x, \mu_{A}(x) \lor \mu_{B}(x), \nu_{A}(x) \wedge \nu_{B}(x)) : x \in X \} \).

Definition 2.5. [10] An IF topology on a nonempty set \( X \) is a family \( \tau \) of IF Sets in \( X \) containing \( \emptyset \) and \( X \) and closed under arbitrary infimum and finite supremum. In this case the pair \((X, \tau)\) is called an IFTS and each IFS in \( \tau \) is known as an IF open set. The compliment of an IF open set in an IFTS \((X, \tau)\) is called an IF closed set in \( X \).

Definition 2.6. [10] Let \((X, \tau)\) is an IF Topological Space and \( A \) an IF Set in \( X \). Then closure of \( A \) is defined by \( cl(A) = \cap \{ F : A \subseteq F, F \in \tau \} \) and the fuzzy interior of \( A \) is defined by \( int(A) = \cup \{ G : A \supseteq G, G \in \tau \} \).

Definition 2.7. [10] Let \( f \) be a map from set \( X \) to set \( Y \). Let \( A =\{ (x, \mu_{A}(x), \nu_{A}(x)) : x \in X \} \) be an IF open set in \( X \) and \( B =\{ (x, \mu_{B}(y), \nu_{B}(y)) : y \in Y \} \) be an IF open set in \( Y \). Then \( f^{-1}(B) \) is an IF open set in \( X \) defined by \( f^{-1}(B) =\{ (x, f^{-1}(\mu_{B}(y)), f^{-1}(\nu_{B}(y))) : x \in X \} \) and \( f(A) \) is an IFOS in \( Y \) defined by \( f(A) =\{ (x, f(\mu_{A}(x)), 1-f(1-\nu_{A}(y))) : y \in Y \} \).

Definition 2.8. [10] A map \( f : (X, \tau) \rightarrow (Y, \sigma) \) is said to be an IF continuous function from IFTS \((X, \tau)\) to IFTS \((Y, \sigma)\) if \( f^{-1}(V) \) is an IF open set in \( X \) for every open set \( V \) of \( Y \).

Definition 2.9. [11] Let \((X, \tau)\) is a topological space. A family \( \tau \) of IFSs on \( X \) is called an IF supra-topological space on \( X \) if \( 0 \in \tau, 1 \in \tau \) and \( \tau \) is closed under arbitrary supremum. Each member of \( \tau \) is called an IF supra-open set and complement of an IF supra-open set is an IF supra-closed set.

Definition 2.10. [12] A fuzzy subset \( A \) of \( X \) is a fuzzy generalized closed set if \( cl(A) \subseteq H \) whenever \( A \subseteq H \), \( H \) being a fuzzy open subset of \( X \).

Definition 2.11. [12] A fuzzy subset \( A \) of \( X \) is a fuzzy dense set if \( cl(A) = X \).

Definition 2.12. [13] An IF set is said to be an IF \( \alpha \)-open set of IFTS \((X, \tau)\) if \( A \subseteq int(cl(int(A))) \).

Definition 2.13. [14] Let \( m_{x} \) an IF \( m_{x} \)-structure on \( X \). An IF \( m_{x} \) open set is said to be an open \( m_{x} \) if \( m_{x} - int(A) = A \).

3. On Intuitionistic Fuzzy \( \alpha \)-Generalized Minimal Closed Sets

In this section the concept of IF \( \alpha \)-generalized minimal open set is introduced and some of its properties are
discussed. Lastly the IF topological structure obtained by the collection of this set is studied.

Definition 3.1. An IF set $A$ is said to be an IF $\alpha$-generalized minimal closed set, if there exist at least one IF Minimal Open Set $U$ containing $A$ such that $acl(A) \subseteq U$.

Example 3.2. Let $A = \{(x,0.3,0.2) : x \in X\}$ and $B = \{(x,0.5,0.3) : x \in X\}$ be two IF subsets of $X$. Let the corresponding topological space be $\tau = \{\phi, 1, A, B, A \cup B, A \cap B\}$. Here $A \cap B$ is an IF Minimal Open Set of $\tau$. Consider a set $C = \{(x,0,2,0.4) : x \in X\}$, then $C \subseteq A \cap B$ and $acl(C) = \{(x,0,2,0.3) : x \in X\} \subseteq A \cap B$. Hence $C$ is an IF $\alpha$-generalized minimal closed set.

Theorem 3.3. Let $A \subseteq B \subseteq U$, where $U$ is an IF minimal open set. If $B$ is an IF $\alpha$-generalized minimal closed set, then $A$ is also so.

Proof. a) Let $B \subseteq U$, where $U$ is an IF minimal open set i.e. $A \subseteq B \subseteq U$. From definition as $B$ is an IF $\alpha$-generalized minimal closed set $acl(B) \subseteq U$ implies $acl(A) \subseteq acl(B) \subseteq U$ i.e. $A$ is also an IF $\alpha$-generalized minimal closed set.

b) Since $B$ is an IF $\alpha$-generalized minimal closed set i.e. $B \subseteq U$ where $U$ is an IF open minimal set and from definition as $B$ is an IF $\alpha$-generalized minimal closed set $acl(B) \subseteq U$ implies $acl(A) = acl(B) \subseteq U$ i.e. $A$ is also an IF $\alpha$-generalized minimal closed set.

Theorem 3.4. An IF set $A$ is IF $\alpha$-generalized minimal closed and IF $\alpha$-minimal open set then $A$ is an IF closed set. Conversely if $A$ be an IF $\alpha$-closed set and an IF minimal open set then $A$ is an IF $\alpha$-generalized minimal closed set.

Proof. Let if possible $A$ be an IF $\alpha$-generalized minimal closed set i.e. there exist an IF minimal open set $U$ containing $A$ such that $acl(A) \subseteq U$. Since $A$ itself is IF $\alpha$-minimal open set $acl(A) \subseteq A$. But we know that $acl(A) \supseteq A$. Hence $acl(A) = A$. i.e. $A$ is an IF $\alpha$-closed set.

Conversely, Let $A$ be an IF $\alpha$-closed set and an IF minimal open set then from definition it is an IF $\alpha$-generalized minimal closed set.

Theorem 3.5. Every IF $\alpha$-generalized minimal closed set is either IF rare set or an IF minimal open set i.e. $A$ is an IF rare set or the IF minimal open set containing $A$ is an IF closed set i.e. $A$ is an IF closed set.

Proof. Let if possible $A$ be an IF $\alpha$-generalized minimal closed set then there exist an IF minimal open set $U$ containing $A$ such that $acl(A) \subseteq U$. Since $A$ itself is IF $\alpha$-minimal open set $acl(A) \subseteq A$. But we know that $acl(A) \supseteq A$. Hence $acl(A) = A$. i.e. $A$ is an IF $\alpha$-closed set.

Converse of the above theorem need not be true which follows from the following example.

Example 3.6. Let $A = \{(x,0,3,0.5) : x \in X\}$, $B = \{(x,0,4,0.6) : x \in X\}$, and the IF topological space is $\tau = \{\phi, 1, A, B, A \cup B, A \cap B\}$. Here $A \cup B$ is the IF minimal open set but not the IF $\alpha$-generalized minimal closed set. Let $C = \{(x,0,5,0.4) : x \in X\}$ be another IF set. $C$ is an IF rare set but not IF $\alpha$-generalized minimal closed set.

Converse of the above theorem need not be true which follows from the following example.

Example 3.7. Every IF $\alpha$-generalized minimal closed set is an IF $\alpha$-generalized closed set.

Proof. Let $A$ be an IF $\alpha$-generalized minimal closed set then there exist an IF minimal open set $U$ such that $A \subseteq U$ implies $acl(A) \subseteq U$. Since $U$ is an IF minimal open set $U \subseteq O$ where $O$ is an IF open set. Hence $acl(A) \subseteq U \subseteq O$. i.e. $A$ is an IF $\alpha$-generalized closed set.

Converse of the above theorem need not be true which follows from the following example.

Example 3.8. Let $A = \{(x,0,4,0.2) : x \in X\}$, $B = \{(x,0,5,0.4) : x \in X\}$, and the IF topological space is $\tau = \{\phi, 1, A, B, A \cup B, A \cap B\}$. Here $A \cup B$ is the IF minimal open set. Let $B = \{(x,0,4,0.3) : x \in X\}$ be another IF set. $C$ is not IF $\alpha$-generalized minimal closed set but IF $\alpha$-generalized closed set.

Theorem 3.9. Let $A$ be any IF $\alpha$-generalized minimal closed set then $\Gamma(A) \subseteq U$, for any IF minimal open set $U$ and hence either $\Gamma(A)$ is not an IF open set or $\Gamma(A) = U$. But we know that $U \subseteq acl(U)$, i.e. infimum of all IF open set containing $A$ is less than the IF minimal open set but it is possible if
and only if either $\Gamma(A)$ is not an open set or $\Gamma(A) = U$. Since $\Gamma(A)$ cannot be null IF set and any IF open set cannot be less than the IF minimal open set. Also we know that arbitrary infimum of IF open set need not be IF open set. So $\Gamma(A)$ may not be an IF open set if $X$ is an arbitrary set. But if $X$ is a collection of IF finite set then $\Gamma(A) = U$.

Theorem 3.10. Let $A$ be any IF generalized minimal closed set then $acl(A) \subseteq \Lambda(A)$ if the set $X$ is finite.

Proof. Since $A$ is an IF $a$-generalized minimal closed set, $A \subseteq U$ where $U$ is an IF minimal open set then $acl(A) \subseteq U$. Therefore $acl(A) \subseteq U = \Lambda(A)$, since $\Lambda(A)$ is the infimum of all IF open set containing $A$ and the set $X$ being finite $\Lambda(A)$ is an IF open set.

Theorem 3.11.
(i) $0$ is an IF $a$-generalized minimal closed set but $1$ is not an IF $a$-generalized minimal closed set.
(ii) Arbitrary union of IF $a$-generalized minimal closed set is an IF $a$-generalized minimal closed set.
(iii) Arbitrary intersection of IF $a$-generalized minimal closed set is an IF $a$-generalized minimal closed set.
Proof. (i) is obvious.
To prove (ii) Let $\{A_i : i \in I\}$ be an arbitrary collection of IF $a$-generalized minimal closed set. Since in an IF topological space there exist a unique IF minimal open set. Let $U$ be the corresponding IF minimal open set. i.e. $A \subseteq U$, where $U$ is an IF minimal closed set, implies $acl(A) \subseteq U$. Therefore $\bigcup A_i : i \in I \bigcup U$, implies $\bigcap acl(A) : i \in I \subseteq U$. But we know that $acl \bigcup A_i : i \in I \subseteq \bigcup acl(A) : i \in U$. Thus arbitrary union of IF $a$-generalized minimal closed set is an IF $a$-generalized minimal closed set.

To prove (iii) Let $\{A_i : i \in I\}$ be an arbitrary collection of IF $a$-generalized minimal closed set. Since in an IF topological space there exist a unique IF minimal open set. Let $U$ be the corresponding IF minimal open set. i.e. $A \subseteq U$, where $U$ is an IF minimal closed set, implies $acl(A) \subseteq U$. Obviously $\bigcap A_i : i \in I \subseteq U$, and thus $acl \bigcap A_i : i \in I \subseteq \bigcap acl(A) : i \in U$. Therefore arbitrary intersection of IF $a$-generalized minimal closed set is an IF $a$-generalized minimal closed set.

Definition 3.12. Let $f : (X, \tau) \to (Y, \sigma)$ be a mapping such that inverse image of IF closed set in $\sigma$ is an IF $a$-generalized minimal closed set in $\tau$. Then this mapping is called an IF $a$-generalized minimal continuous mapping.

Theorem 3.13. Let $f : (X, \tau) \to (Y, \sigma)$ be an IF $a$-generalized minimal continuous function then it is an IF $a$-generalized continuous function.
Proof. It is obvious from Theorem 3.7.
Remark 3.14. Converse of the above theorem need not be true which follows from the following example:
Let $A = \{(x, 0.4, 0.2) : x \in X\}$, $B = \{(x, 0.5, 0.4) : x \in X\}$ and the IF topological space is $\tau = \{0, 1, A, B, A \cup B, A \cap B\}$. Here $A \cap B$ is the IF minimal open set. Let $C = \{(x, 0.4, 0.3) : x \in X\}$ be another IF set. $C$ is not IF $a$-generalized minimal closed set but IF $a$-generalized closed set. Let us consider a mapping $g : (X, \tau) \to (Y, \sigma)$ such that $f^{-1}(x) = C$ for all $x \in \sigma$. Here $f$ is IF $a$-generalized continuous but not IF $a$-generalized minimal continuous function.

Theorem 3.15. Let $f : (X, \tau) \to (Y, \sigma)$ be an IF $a$-generalized minimal continuous function and $g : (Y, \sigma) \to (Z, \eta)$ be an IF continuous function then $g \circ f : (X, \tau) \to (Z, \eta)$ is an IF $a$-generalized minimal continuous function.
Proof. Here $(g \circ f)^{-1} = f^{-1} g^{-1}$. Now $g$ is IF continuous function then $g^{-1}(z)$ is an IF closed set whenever $z$ is an IF closed set in $Z$ and hence $f^{-1} g^{-1}(x)$ is an IF $a$-generalized minimal closed, since $f$ is an IF $a$-generalized minimal continuous function. Hence inverse image of a IF closed set in $Z$ is an IF $a$-generalized minimal closed set in $X$. Thus $(g \circ f)$ is an IF $a$-generalized minimal continuous function.

4. On Intuitionistic Fuzzy $a$-Generalized* Minimal Closed Sets

In this section the concept of IF $a$-generalized* minimal open set is introduced and some theorems related to this newly constructed set are studied and also related properties are discussed.

Definition 4.1. An IF set $B$ is said to be an IF $a$-generalized* minimal closed set, if there exist at least one IF Minimal Open Set $A$ containing $B$ such that $acl(B) \supseteq B$.

Example 4.2. Let $A = \{(x, 0.2, 0.6) : x \in X\}$ and $B = \{(x, 0.3, 0.7) : x \in X\}$ be two IF subsets of $X$. Let the corresponding topological space be $\tau = \{0, 1, A, B, A \cup B, A \cap B\}$. Here $A \cap B$ is an IF Minimal Open Set of $\tau$. Consider a set $C = \{(x, 0.1, 0.8) : x \in X\}$, then $C \subseteq A \cap B$ and $acl(C) = \{(x, 0.6, 0.3) : x \in X\} \supseteq A \cap B$. Hence $C$ is an IF $a$-generalized* minimal closed set.
Theorem 4.3.
(i) Let \( A \subseteq B \subseteq U \), where \( U \) is an IF minimal open set. If \( A \) is an IF \( \alpha \)-generalized* minimal closed set, then \( B \) is also so.

(ii) If \( A \subseteq B \subseteq acl(U) \) and \( B \) is an IF \( \alpha \)-generalized* minimal closed set then \( A \) is also so.

Proof. (i) Let \( B \subseteq U \), where \( U \) is an IF minimal open set i.e. \( A \subseteq B \subseteq U \). From definition as \( A \) is an IF \( \alpha \)-generalized* minimal closed set \( acl(A) \supseteq U \) implies \( acl(A) \supseteq acl(B) \supseteq U \). i.e. \( B \) is also an IF \( \alpha \)-generalized* minimal closed set.

(ii) Since \( B \) is an IF \( \alpha \)-generalized* minimal closed set i.e. \( B \subseteq U \) where \( U \) is an IF minimal open set and from definition as \( B \) is an IF \( \alpha \)-generalized* minimal closed set \( acl(B) \supseteq U \) implies \( acl(A) \supseteq acl(B) \supseteq U \). i.e. \( A \) is also an IF \( \alpha \)-generalized* minimal closed set.

Remark 4.4. There does not exist any IF Minimal Open Set between \( A \) and \( B \) such that \( A \subseteq B \) and \( A \) is an IF \( \alpha \)-generalized* minimal open set.

Theorem 4.5. If \( A \) is an IF \( \alpha \)-generalized* minimal open set then \( int(A) = 0 \), \( int(A) = A \). i.e. \( A \) is an IF rare set or an IF minimal open set.

Proof. As \( int(A) \) is an IF Open Set and \( int(A) \subseteq A \subseteq B \) (for some IF Minimal Open Set) \( int(A) = 0 \), or \( A \) as IF Minimal Open Set does not contain any IF Open Set other than itself or \( 0 \).

Remark 4.6. The converse of the above theorem may not be true and it can be shown with the help of an example:

Let \( A = \{ (x, 0.2, 0.4) : x \in X \} \) be an IF of \( X \) and the corresponding topological space be \( \tau = \{ 0, 1, A \} \). Here \( A \) is an IF Minimal Open Set of \( \tau \). Consider a set \( C = \{ (x, 0.1, 0.3) : x \in X \} \), \( int(C) = 0 \), but \( C \) is not an IF \( \alpha \)-generalized* minimal open set.

Theorem 4.7. Every IF Minimal Open Set is an IF \( \alpha \)-generalized* minimal open set in itself.

Proof. Let \( A \) is an IF Minimal Open Set. We know that \( acl(A) \supseteq A \). Since \( A \) is a minimal open set, so from definition \( A \) is an IF \( \alpha \)-generalized* minimal open set.

Remark 4.8. The converse of the above theorem need not be true, as IF Set \( C \) in example 4.2 is an IF \( \alpha \)-generalized* minimal open set but it is not an IF Minimal Open Set. According to the theorem 4.5 the converse is true if the set is not a rare set. i.e. for a set which is not rare, IF minimal open set and IF \( \alpha \)-generalized* minimal open set are similar concepts.

Theorem 4.9. If \( B(\neq 0) \) is an IF Open Set then \( B \) will be IF \( \alpha \)-generalized* minimal open set iff \( B \) is an IF Minimal Open Set.

Proof. Let \( B \) is an IF Open Set which is IF \( \alpha \)-generalized* minimal open set. From definition there exist a IF minimal open set \( A \) containing \( B \) such that \( acl(B) \supseteq A \). But an IF Minimal Open Set does not contain any other IF Open Set except itself i.e. \( B = A \) implies \( B \) is an IF Minimal Open Set.

Conversely, let \( B \) is an IF Minimal Open Set, then as proved in theorem 4.7, \( B \) is an IF \( \alpha \)-generalized* minimal open set.

Theorem 4.10. Every IF-dense set is an IF \( \alpha \)-generalized* minimal open set if it is a subset of some IF Minimal Open Set but the converse is not true.

Proof. Let \( A \) is an IF \( \tau \) dense set \( \Rightarrow cl(A) = 1 \Rightarrow acl(A) = 1 \). If \( A \subseteq B \) \( (B \) is an IF \( \alpha \)-generalized* minimal open set), then \( acl(A) = 1 \Rightarrow B \). This implies \( A \) is an IF \( \alpha \)-generalized* minimal open set.

The converse is not true as shown in example 4.6. \( C \) is an IF \( \alpha \)-generalized* minimal open set, but \( C \) is not an IF \( \alpha \)-generalized* minimal open set.

Theorem 4.11. An IF \( \alpha \)-generalized* minimal open set \( A \) is IF \( \alpha \)-generalized closed set if and only if \( acl(C) = B \), where \( B \) is an IF Minimal Open Set.

Proof. Since \( A \) is an IF \( \alpha \)-generalized* minimal open set, \( A \subseteq B \) where \( B \) is an IF minimal open set and

\[
\text{acl}(A) \supseteq B \quad (1)
\]

But \( A \) is IF \( \alpha \)-generalized closed set which implies

\[
\text{acl}(A) \subseteq B \quad (2)
\]

So from (1) and (2) \( \text{acl}(A) = B \).

Conversely let \( \text{acl}(A) = B \) and \( A \) is an IF \( \alpha \)-generalized* minimal open set, from definition \( A \subseteq B \) implies \( \text{acl}(A) \supseteq B \), but \( \text{acl}(A) = B \). i.e. \( \text{acl}(A) \subseteq B \) implies \( A \) is IF \( \alpha \)-generalized closed set.

Theorem 4.12. If the IF minimal open set containing a \( \alpha \)-generalized* minimal closed set is IF closed set then
the $\alpha$-generalized* minimal closed set is a IF Pre-open set.

Proof. Let $U$ be a IF minimal open set containing $A$. Since $A$ is an $\alpha$-generalized* minimal closed set, $\text{acl}(A) \supseteq U$. Since $U \supseteq A$, $\text{acl}(A) \supseteq \text{acl}(U) = U$. Since $U$ is an IF closed set. Therefore $\text{int}(U) = \text{int}(\text{acl}(A)) \supseteq A$. Hence $A$ is an IF Pre-open Set.

Theorem 4.13. Let $A$ be an closed set and an IF $\alpha$-generalized* minimal closed set then $A$ is the minimal open set.

Proof. Let $U$ be a IF minimal open set containing $A$. Since $A$ is an IF $\alpha$-generalized* minimal closed set, $\text{acl}(A) \supseteq U$ i.e. $A \supseteq U$ i.e. $A = U$. Hence $A$ is an IF minimal open set.

Theorem 4.14. Arbitrary union of IF $\alpha$-generalized* minimal open set is an IF $\alpha$-generalized* minimal open set if it is contained in an IF minimal open set.

Proof. Let $\bigcup \{B_i : i \in I\} \subseteq A$ (where $A$ is an IF Minimal Open Set and $i \in I$).

$\Rightarrow \{B_i : i \in I\} \subseteq A \Rightarrow \text{acl}(\{B_i : i \in I\}) \supseteq A \Rightarrow \text{acl}(\{B_i : i \in I\}) \supseteq \text{acl}(A)$ for $\text{acl}(A)$ is an IF $\alpha$-generalized* minimal closed set.

Remark 4.15. The collection of all IF $\alpha$-generalized* minimal open set forms an IF supra topological space if $\alpha \neq 0$ and $1$. are included in the collection. This supra topological space may be denoted as $(X, \alpha g * M)$ and is named as IF $\alpha$-generalized* minimal supra topological space.

Theorem 4.16. An IF set $A$ of $X$ is both IF $\alpha$-generalized minimal closed set and IF $\alpha$-generalized* minimal closed set iff $\text{acl}(A) = U$.

Theorem 4.17. The union of an IF $\alpha$-generalized minimal closed set and an IF $\alpha$-generalized* minimal closed set is an IF $\alpha$-generalized* minimal closed set.

Proof. Let $A$ be an IF $\alpha$-generalized minimal closed set and $B$ be an IF $\alpha$-generalized* minimal closed set in the same IF topological space. Let $P = A \cup B$. Here $\text{acl}(A) \subseteq U \subseteq \text{acl}(B)$. Therefore $P = A \cup B \subseteq U$ and $\text{acl}(A \cup B) = \text{acl}(A) \cup \text{acl}(B) = \text{acl}(B) \supseteq U$. Hence $P$ is an IF $\alpha$-generalized* minimal closed set.
