Abstract

The first part of this paper gives the definition about complex fuzzy structured element on the basis of one-dimensional fuzzy structured element and some of its property. The following part introduces its limit and continuity. All of this has opened up a vision for the research of fuzzy structured element, and also played an important role in promoting its progress.

Keywords: complex fuzzy structured element, \( E^{(2)} \) - \( F^{(2)} \) modulus, continuity of complex fuzzy structured element

1. Introduction

Many scholars have further studied the fuzzy structured element, and they also have given out a lot of properties about the fuzzy structured element. But the study of complex fuzzy structured element is at its beginning stage. In this paper, we study the complex fuzzy structured element, which breaking the blank situation of researching the complex fuzzy structured element, and laying a foundation for the further research of complex fuzzy structured element. It also breaks the blank field of researching area in complex fuzzy number, and brings motivations for people to study the calculus in the field of the fuzzy structured element. Meanwhile, it also enriches the knowledge of fuzzy mathematics and widens the vision for the research of the fuzzy control, fuzzy decision-making, etc. It also broadens a new area for its study. Of course, the study of this paper is a qualitative leap from the real area to the complex area, and brings great convenience for the information classification and management.

2. The \( E^{(2)} \) - \( F^{(2)} \) Modulus of the Complex Fuzzy Structured Element and Its Related Concept

2.1. The Complex Fuzzy Structured Element

Definition 2.1.1 Let \( E^{(2)} \) be a fuzzy set of \( R^2 \) in the two-dimensional real number field, its membership function recorded as: \( \mu_{E^{(2)}}(x,y) \), here \( \mu_{E^{(2)}}(x,y) = \frac{B(x)+C(y)}{2} \), \( x, y \in R \), if \( B(x), C(y) \) meet the following nature, we say the two-dimensional fuzzy set \( E^{(2)} \) is complex fuzzy structuring element of \( R^2 \).

1) \( B(0) = 1, C(0) = 1, B(1+0) = B(-1-0) = 0, C(1+0) = C(-1-0) = 0 \)
2) In the interval \([0,1] \) \( B(x), C(y) \) is a single by...
left-continuous function, In the interval \((0,1]\) is a single down the right continuous function.

3) When \(-\infty<x<1, -\infty<y<1\) and \(1<x<\infty\), \(1<y<\infty\), we have \(B(x) = C(y) = 0\), that is to say \(E^{(2)}(x,y) = 0\).

If a fuzzy number \(A^{(2)} = ar E^{(2)} + it F^{(2)}\) (here \(a, t\) are real numbers, and \(r, t > 0\), \(E^{(2)}, F^{(2)}\) are complex fuzzy structuring element), we say \(A^{(2)}\) is generated by a linear of \(E^{(2)}, F^{(2)}\), here \(A^{(2)}(x,y) = \frac{(a+r E^{(2)}(x,y)) + t F^{(2)}(x,y)}{2}\). Here we state \(E^{(2)} - F^{(2)}\) is all the fuzzy numbers generated by the linear \(E^{(2)}\) and \(F^{(2)}\).

**Definition 2.1.2** \(E^{(2)} - F^{(2)}\) is all the fuzzy numbers generated by the linear \(E^{(2)}, F^{(2)}\), let \(A^{(2)} \in E^{(2)} - F^{(2)}\). There exist limited real numbers \(a, r, t \in R, r, t > 0\), such that \(A^{(2)} = a + r E^{(2)} + it F^{(2)}\), \(r, t > 0\), we say \(\sqrt{a^2 + r^2 + t^2}\) is the modulus of the complex fuzzy number \(A^{(2)}\). Recorded as \(|A^{(2)}| = \sqrt{a^2 + r^2 + t^2}\).

**Definition 2.1.3** \(E^{(2)} - F^{(2)}\) —distance \((E - dist\, cF^{(2)})\), let complex fuzzy number \(A^{(2)}, B^{(2)} \in E^{(2)} - F^{(2)}\) and \(A^{(2)} = a_1 + r_1 E^{(2)} + it_1 F^{(2)}\), \(B^{(2)} = a_2 + r_2 E^{(2)} + it_2 F^{(2)}\), here \(a_1, a_2, r_1, r_2, t_1, t_2 \in R\) and \(r_1, r_2, t_1, t_2 > 0\).

We say \(\sqrt{(a_1 - a_2)^2 + (r_1 - r_2)^2 + (t_1 - t_2)^2}\) is the distance of the complex fuzzy number \(A^{(2)}\) and \(B^{(2)}\), Recorded as \(d_{E^{(2)}, F^{(2)}}(A^{(2)}, B^{(2)})\), That is

\[
d_{E^{(2)}, F^{(2)}}(A^{(2)}, B^{(2)}) = \sqrt{(a_1 - a_2)^2 + (r_1 - r_2)^2 + (t_1 - t_2)^2} \tag{2}
\]

### 2.2. Subtraction and Multiply of Complex Fuzzy Structuring Element

**Definition 2.2.1.** Let \(A^{(2)}, B^{(2)}\), \(C^{(2)} \in E^{(2)} - F^{(2)}\), \(A^{(2)} = a_1 + r_1 E^{(2)} + it_1 F^{(2)}\), \(B^{(2)} = a_2 + r_2 E^{(2)} + it_2 F^{(2)}\), \(C^{(2)} = a_3 + r_3 E^{(2)} + it_3 F^{(2)}\), here \(a_1, a_2, r_1, r_2, t_1, t_2 \in R\) and \(r_1, r_2, t_1, t_2 > 0\). If \(a_3 = a_1 + a_2\), \(r_3 = r_1 + r_2\), \(t_3 = t_1 + t_2\), we say \(C^{(2)}\) is \(A^{(2)}\) plus \(B^{(2)}\).

Recorded as \(C^{(2)} = A^{(2)} + B^{(2)}\).

**Definition 2.2.2** Let \(A^{(2)}, B^{(2)}\), \(C^{(2)} \in E^{(2)} - F^{(2)}\), \(A^{(2)} = a_1 + r_1 E^{(2)} + it_1 F^{(2)}\), \(B^{(2)} = a_2 + r_2 E^{(2)} + it_2 F^{(2)}\), \(C^{(2)} = a_3 + r_3 E^{(2)} + it_3 F^{(2)}\), here \(a_1, a_2, r_1, r_2, t_1, t_2 \in R\) and \(r_1, r_2, t_1, t_2 > 0\). If \(a_3 = a_1 - a_2\), \(r_3 = r_1 - r_2\), \(t_3 = t_1 - t_2\), we say \(C^{(2)}\) is the subtraction of \(A^{(2)}\) and \(B^{(2)}\), Recorded as \(C^{(2)} = A^{(2)} - B^{(2)}\).

**Definition 2.2.3** Let \(A^{(2)}, C^{(2)} \in E^{(2)} - F^{(2)}\), \(A^{(2)} = a_1 + r_1 E^{(2)} + it_1 F^{(2)}\), \(C^{(2)} = a_3 + r_3 E^{(2)} + it_3 F^{(2)}\), here \(a_1, a_2, r_1, r_2, t_1, t_2 \in R\) and \(r_1, r_2, t_1, t_2 > 0\). If \(a_3 = ka_1\), \(r_3 = kr_1\), \(t_3 = kt_1\), we say \(C^{(2)}\) is \(k\) multiply \(A^{(2)}\).

Recorded as \(C^{(2)} = k A^{(2)}\).

### 3. The Limit of the Complex Fuzzy Structuring Element

**Definition 3.1** Let \(A^{(2)} \in E^{(2)} - F^{(2)}\), \(A^{(2)} \in E^{(2)} - F^{(2)}\), \(\forall \varepsilon > 0\), \(\exists N\), such that \(n > N\), \(d_{E^{(2)}, F^{(2)}}(A^{(2)}, A^{(2)}) < \varepsilon\) is true, we say \(\{A^{(2)}_n\}\) converge to \(A^{(2)}\) according to fuzzy distance \(d_{E^{(2)}, F^{(2)}}\).

Recorded as \(\lim_{n \to \infty} A^{(2)}_n = A^{(2)}\).

In the following we give a theorem about the convergence of complex fuzzy numbers with the help of \(E^{(2)} - F^{(2)}\) —distance.
Theorem 3.1. Let $A_n^{(2)}, A^{(2)} \in \varepsilon(E^{(2)}), A^{(2)} = a + r(E^{(2)} + it(E^{(2)}),$ $A_n^{(2)} = a_n + r_n(E^{(2)}) + it_n(E^{(2)})$, here $a, a_n, r, r_n, t, t_n \in R$ and $r, r_n, t, t_n > 0$, if \( \forall \varepsilon > 0, \exists \delta > 0 \), such that when $|a - a_n| < \delta$, $|r - r_n| < \delta, |t - t_n| < \delta$, constant have inequality $d_{E^{(2)}}^{(2)}(A_n^{(2)}, A^{(2)}) < \varepsilon$ is true. That is $A_n^{(2)}$ converge to $A^{(2)}$ according to fuzzy distance $d_{E^{(2)}}^{(2)}$.

Proof. In fact, we choose $\delta = \frac{\varepsilon}{\sqrt{3}},$.

From the meaning of the question we know $\exists N$, when $n > N$, $|a - a_n| < \frac{\varepsilon}{\sqrt{3}}, |r - r_n| < \frac{\varepsilon}{\sqrt{3}}, |t - t_n| < \frac{\varepsilon}{\sqrt{3}}$, that is when $n > N$,

$$d_{E^{(2)}}^{(2)}(A_n^{(2)}, A^{(2)}) = \sqrt{(a-a_n)^2 + (r-r_n)^2 + (t-t_n)^2}$$

$$< \sqrt{\left(\frac{\varepsilon}{\sqrt{3}}\right)^2 + \left(\frac{\varepsilon}{\sqrt{3}}\right)^2 + \left(\frac{\varepsilon}{\sqrt{3}}\right)^2} = \varepsilon$$

So $A_n^{(2)}$ converge to $A^{(2)}$ according to the fuzzy distance $d_{E^{(2)}}^{(2)}$.

Theorem 3.2 (Complex fuzzy limits with a number of addition, subtraction and multiplication theorem)

Let $\left\{A_{n}^{(2)}\right\}, \left\{B_{n}^{(2)}\right\} \in \varepsilon(E^{(2)} - F^{(2)}), A^{(2)}, B^{(2)} \in$$\varepsilon(E^{(2)} - F^{(2)}), k \in R$, if \( \lim_{n \to \infty} A_{n}^{(2)} = A^{(2)} \), \( \lim_{n \to \infty} B_{n}^{(2)} = B^{(2)} \),

$$\lim_{n \to \infty} d_{E^{(2)}}^{(2)}(A_{n}^{(2)}, A^{(2)}) = 0$$

1) $\lim_{n \to \infty} (A_{n}^{(2)} + B_{n}^{(2)}) = A^{(2)} + B^{(2)}$ \hspace{1cm} (3)

2) $\lim_{n \to \infty} (A_{n}^{(2)} - B_{n}^{(2)}) = A^{(2)} - B^{(2)}$ \hspace{1cm} (4)

3) $\lim_{n \to \infty} k A_{n}^{(2)} = k A^{(2)}$ \hspace{1cm} (5)

Proof. Only serves to prove (3), It is easy to get the result when $k = 0$. In the following we prove the conclusion is correct when $k \neq 0$.

Because \( \lim_{n \to \infty} A_{n}^{(2)} = A^{(2)} \)

Then we know \( \forall \varepsilon > 0, \exists N, n > N \),

$$d_{E^{(2)}}^{(2)}(A_{n}^{(2)}, A^{(2)}) < \frac{\varepsilon}{k} \hspace{1cm} (k \neq 0)$$

So \( d_{E^{(2)}}^{(2)}(kA_{n}^{(2)}, kA^{(2)}) = kd_{E^{(2)}}^{(2)}(A_{n}^{(2)}, A^{(2)}) < \varepsilon \).

Theorem 3.3 (The uniqueness of the limit) Let \( \left\{A_{n}^{(2)}\right\} \in \varepsilon(E^{(2)}), A^{(2)}, B^{(2)} \in \varepsilon(E^{(2)}), \)

\( \lim_{n \to \infty} A_{n}^{(2)} = A^{(2)} \), \( \lim_{n \to \infty} A_{n}^{(2)} = B^{(2)} \),

we have \( A^{(2)} = B^{(2)} \).

Proof. Because

\( \lim_{n \to \infty} d_{E^{(2)}}^{(2)}(A_{n}^{(2)}, A^{(2)}) = 0 \),

\( \lim_{n \to \infty} d_{E^{(2)}}^{(2)}(A_{n}^{(2)}, B^{(2)}) < \frac{\varepsilon}{2} \).

Similarly, when $n > N$, we have \( d_{E^{(2)}}^{(2)}(A_{n}^{(2)}, B^{(2)}) \)

\( < \frac{\varepsilon}{2} \).

Let \( N = \max(N_1, N_2) \), when $n > N$, then

\( 0 < d_{E^{(2)}}^{(2)}(A^{(2)}, B^{(2)}) < d_{E^{(2)}}^{(2)}(A_{n}^{(2)}, A^{(2)}) + d_{E^{(2)}}^{(2)}(A_{n}^{(2)}, B^{(2)}) < \varepsilon \)

As \( \varepsilon \) is arbitrary we obtain:

$$d_{E^{(2)}}^{(2)}(A^{(2)}, B^{(2)}) = 0$$

That is

$$A^{(2)} = B^{(2)}$$

Definition 3.2 Let \( \left\{A_{n}^{(2)}\right\} \in \varepsilon(E^{(2)}), \left\{A^{(2)}\right\} \in \varepsilon(E^{(2)}), \)

\( \left\|A^{(2)}\right\|_{E^{(2)}} \leq M \) is always right, we say \( A^{(2)} \) is bounded.

Theorem 3.4 (Bounded theorem) Let \( \left\{A_{n}^{(2)}\right\} \in \varepsilon(E^{(2)}), \left\{A^{(2)}\right\} \in \varepsilon(E^{(2)}), \)

\( \lim_{n \to \infty} A_{n}^{(2)} = A^{(2)} \) and \( A^{(2)} \) is bounded, then we say \( \left\{A_{n}^{(2)}\right\} \)
is bounded.

**Proof.** because $A^{(2)}$ is bounded and

$$\lim_{n \to \infty} A_n^{(2)} = A^{(2)}$$

then $\exists M_1$, s.t $|A^{(2)}| < M_1$, also $\forall N$ when $n > N$, we have $d_{E^{(2)},F^{(2)}}(A^{(2)}, A_n^{(2)}) < \varepsilon$.

Let $\varepsilon = 1$, then we have $\|A^{(2)}\| - |A^{(2)}| < 1$

That is to say $|A^{(2)}| < 1$

Here we choose $M = M_1 + 1$

We can get $|A^{(2)}| \leq M$, So $\{A^{(2)}\}_n$ is bounded.

### 4. The Continuous Definition of Complex Fuzzy Structuring Element

First of all, we know $a + r E^{(2)}$ is a fuzzy structuring element, for $A^{(2)} \in E(E^{(2)})$, $A^{(2)} = a + r E^{(2)} + it F^{(2)}$, $r, t > 0$, refer to the continuity of fuzzy structuring element, we give out the continuous definition of complex fuzzy structuring element.

**Definition 4.1** Let $A^{(2)} = a + r E^{(2)} + it F^{(2)}$, $r, t \in R$ and $r, t > 0$, if fuzzy structuring element $a + r E^{(2)}$ and $t F^{(2)}$ is continuous at every point $(x, y) \in D \times D \subset R \times R$, we say $A^{(2)}$ is continuous in $D \times D$.

Now we give the continuous definition of complex fuzzy structuring element at some point.

**Definition 4.2** Let $A^{(2)} \in E(E^{(2)})$, $(x_0, y_0) \in R \times R$, if

$$\lim_{x \to x_0, y \to y_0} A^{(2)}(x, y) = A^{(2)}(x_0, y_0),$$

we say the complex fuzzy structuring element $A^{(2)}$ is continuous at $(x_0, y_0)$.

In the above definition, if we want to determine whether a fuzzy-valued functions is continuous in $D \times D$, we should verify every point $(x, y) \in D \times D$, which is very different to verification. Therefore, this is only a theory definition. Here we give a determine theorem about the continuous of complex fuzzy structuring element.

**Determine theorem 4.1** Let $A^{(2)} = a + r E^{(2)} + it F^{(2)}$, $r, t \in R$ and $r, t > 0$, $E^{(2)}(x, y) = \frac{B_r(x) + C_r(y)}{2}$, $F^{(2)}(x, y) = \frac{B_r(x) + C_r(y)}{2}$, $\forall (x, y) \in R$, then as long as the membership function $B_r(x), C_r(y)$, $B_r(x), C_r(y)$ is continuous in $D$, we obtain $A^{(2)}(x, y)$ is continuous in $D$.

**Proof.** From the preceding introduce we know that:

$$A^{(2)}(x, y) = \frac{(a + r E^{(2)}(x, y)) + t F^{(2)}(x, y)}{2}$$

Therefore $\forall (x_0, y_0) \in D \times D$ we have

$$A^{(2)}(x_0, y_0) = \frac{(a + r E^{(2)}(x_0, y_0)) + t F^{(2)}(x_0, y_0)}{2}$$

So

$$A^{(2)}(x, y) - A^{(2)}(x_0, y_0) = \frac{r}{2} \left( E^{(2)}(x, y) - E^{(2)}(x_0, y_0) \right) + \frac{t}{2} \left( F^{(2)}(x, y) - F^{(2)}(x_0, y_0) \right)$$

Because the membership function $B_r(x), C_r(y)$, $B_r(x), C_r(y)$ are continuous in $D$, we know when $\forall \varepsilon > 0, \exists \delta > 0$, $|x - x_0| < \delta, |y - y_0| < \delta$,

$$\frac{B_r(x)}{2} - \frac{B_r(x_0)}{2} < \frac{\varepsilon}{2r}, \frac{C_r(y)}{2} - \frac{C_r(y_0)}{2} < \frac{\varepsilon}{2r}$$

$$\frac{B_r(x)}{2} - \frac{B_r(x_0)}{2} < \frac{\varepsilon}{2t}, \frac{C_r(y)}{2} - \frac{C_r(y_0)}{2} < \frac{\varepsilon}{2t}$$

Thus we obtain

$$A^{(2)}(x, y) - A^{(2)}(x_0, y_0) < \varepsilon$$

Due to the arbitrariness of $(x, y) \in D$, we know $A^{(2)}(x, y)$ is continuous in $D$.

### 5. References
