Abstract
A numerical method based on septic B-spline function is presented for the solution of linear and nonlinear fifth-order boundary value problems. The method is fourth order convergent. We use the quasilinearization technique to reduce the nonlinear problems to linear problems and use B-spline collocation method, which leads to a seven nonzero bands linear system. Illustrative example is included to demonstrate the validity and applicability of the proposed techniques.

Keywords
Septic B-Spline Function, Fifth-Order Boundary Value Problems, B-Spline Collocation Method, Nonlinear Problems

1. Introduction
Consider the following fifth-order boundary value problem.

\[ Ly(x) = y^{(5)}(x) + p(x)y(x) = f(x), \quad c < x < d \] \hspace{1cm} (1)

With boundary conditions

\[ y(c) = \alpha_0, \quad y^{(3)}(c) = \alpha_1, \quad y^{(2)}(c) = \alpha_2, \]
\[ y(d) = \alpha_3, \quad y^{(3)}(d) = \alpha_4, \quad y^{(2)}(d) = \alpha_5 \] \hspace{1cm} (2)

where \( \alpha_i \) (i = 0, 1, 2, 3, 4, 5) are known real constants, \( p(x) \) and \( f(x) \) are continuous on \([c, d] \). This problem arising in the mathematical modeling of viscoelastic flows [1] [2] has been studied by several authors [3]-[5]. A. Lamnii, H. Mraoui, D. Sbibih and A. Tijini studied the fifth-order boundary value problem based on splines quasi-interpolants and proved to be second order convergent.
B-spline functions based on piece polynomials are useful wavelet basis functions, the resulting matrices are sparse, but always, banded. And that possess attractive properties: piecewise smooth, compact support, symmetry, rapidly decaying, differentiability, linear combination, B-splines were introduced by Schoenberg in 1946 [6]. Up to now, B-spline approximation method for numerical solutions has been researched by various researchers [7]-[14].

In this paper, the septic B-spline function is used as a basis function and the B-spline collocation method is studied to solve the linear and nonlinear fifth-order boundary value problems. The method is fourth order convergent. We use the quasilinearization technique to reduce the nonlinear problems to linear problems. The present method is tested for its efficiency by considering two examples.

2. Septic B-Spline Interpolation

An arbitrary Nth order spline function with compact support of N. It is a concatenation of N sections of (N-1)th order polynomials, continuous at the junctions or “knots”, and gives continuous (N-1)th derivatives at the junctions.

Let \( \{x_i\}_{i=0}^{N} \) be a uniform partition of \( [c,d] \) such that \( x_i = c + ih \), \( i = 0,1,2,\ldots,N \), where \( h = (d-c)/N \). Let the septic B-spline function \( \phi (x) \) with knots at the points \( x_i \) be given by

\[
\phi (x) = \frac{1}{h} \begin{cases} 
(x-x_{i-4})^7, & x \in [x_{i-4}, x_{i-3}] \\
(x-x_{i-4})^7 - 8(x-x_{i-3})^7, & x \in [x_{i-3}, x_{i-2}] \\
(x-x_{i-4})^7 - 8(x-x_{i-3})^7 + 28(x-x_{i-2})^7, & x \in [x_{i-2}, x_{i-1}] \\
(x-x_{i-4})^7 - 8(x-x_{i-3})^7 + 28(x-x_{i-2})^7 - 56(x-x_{i-1})^7, & x \in [x_{i-1}, x_i] \\
(x_{i+4}-x)^7 - 8(x_{i+3}-x)^7 + 28(x_{i+2}-x)^7 - 56(x_{i+1}-x)^7, & x \in [x_i, x_{i+1}] \\
(x_{i+4}-x)^7 - 8(x_{i+3}-x)^7 + 28(x_{i+2}-x)^7, & x \in [x_{i+1}, x_{i+2}] \\
(x_{i+4}-x)^7 - 8(x_{i+3}-x)^7, & x \in [x_{i+2}, x_{i+3}] \\
(x_{i+4}-x)^7, & x \in [x_{i+3}, x_{i+4}] \\
0, & \text{otherwise}
\end{cases}
\]  

(3)

The set of splines \( \{\phi_3, \phi_2, \phi_1, \phi_0, \phi_{N+1}, \phi_{N+2}, \phi_{N+3}\} \) forms a basis for the functions defined over \( [c,d] \). The values of \( \phi (x) \) and its derivatives are as shown in Table 1.

We seek the approximation \( S(x) \) to the exact solution \( y(x) \), which uses these septic B-splines:

\[
S(x) = \sum_{i=3}^{N+3} a_i \phi_i (x)
\]  

(4)

which satisfies the following interpolation conditions:

\[
\begin{align*}
  s(x_i) &= y(x_i), \quad (i = 0,1,2,\ldots,n) \\
  s^{(1)}(c) &= y^{(1)}(c), \quad s^{(2)}(c) = y^{(2)}(c), \\
  s^{(1)}(d) &= y^{(1)}(d), \quad s^{(2)}(d) = y^{(2)}(d),
\end{align*}
\]  

(5)

where \( a_i \) are unknown real coefficients.

Using the septic B-spline function Equation (3) and the approximate solution Equation (4), the nodal values \( S(x_j) \) and \( S^{(5)}(x_j) \) at the node \( x_j \) are given in terms of element parameters by

\[
S(x_j) = a_{j+3} + 120a_{j+2} + 1191a_{j+1} + 2416a_j + 1191a_{j-1} + 120a_{j-2} + a_{j-3}
\]  

(6)

\[
S^{(5)}(x_j) = \frac{2520}{h^5} (-a_{j-3} + 4a_{j-2} - 5a_{j-1} + 4a_{j+1} - a_{j+2} + a_{j+3})
\]  

(7)

</tbody>
</table>

From Equations (4)-(7), we have

$$s^{(5)}(x) + 120s^{(5)}(x_{j-2}) + 1191s^{(5)}(x_{j-1}) + 2416s^{(5)}(x_j) + 1191s^{(5)}(x_{j+1}) + 120s^{(5)}(x_{j+2}) + s^{(5)}(x_{j+3}) = \frac{2520}{h^5}(-y_{j-3} + 4y_{j-2} - 5y_{j-1} + 5y_{j+1} - 4y_{j+2} + y_{j+3}),$$

(8)

Using operator notations $Ey(x) = y(x + h), Dy(x) = y'(x), Jy(x) = y(x), E = e^{i\theta}$, we obtain

$$s^{(5)}(x) = \frac{2520}{h^5}\left(-E^{-3} + 4E^{-2} - 5E^{-1} + 5E^1 - 4E^2 + E^3\right)y_j,$$

(9)

Expanding them in powers of $hD$, we obtain

$$s^{(5)}(x) = y^{(5)}(x) - \frac{h^4}{240}y^{(9)}(x) - \frac{59h^6}{15120}y^{(11)}(x) + \frac{259h^8}{226800}y^{(13)}(x) + O(h^{10})$$

(10)

Hence we get

$$y(x) = a_{j-3} + 120a_{j-2} + 1191a_{j-1} + 2416a_j + 1191a_{j+1} + 120a_{j+2} + a_{j+3} + O(h^4)$$

(11)

$$y^{(5)}(x) = \frac{2520}{h^5}(-a_{j-3} + 4a_{j-2} - 5a_{j-1} + 5a_{j+1} - 4a_{j+2} + a_{j+3}) + O(h^4)$$

(12)

### 3. Spline Collocation Method

#### 3.1. Linear Problems

From Equation (1) and Equation (12), we can get

$$\frac{2520}{h^5}(-a_{j-3} + 4a_{j-2} - 5a_{j-1} + 5a_{j+1} - 4a_{j+2} + a_{j+3}) + O(h^4) + p_j(a_{j-3} + 120a_{j-2} + 1191a_{j-1} + 2416a_j + 1191a_{j+1} + 120a_{j+2} + a_{j+3}) = f_j$$

(13)

Using the boundary conditions and by neglecting the error of Equation (13), we can obtain following linear equations

$$\begin{align*}
&\left[\frac{2520}{h^5} + p_j\right]a_{j-3} + \left[\frac{10080}{h^5} + 120p_j\right]a_{j-2} + \left[\frac{12600}{h^5} + 1191p_j\right]a_{j-1} + \left[\frac{12600}{h^5} + 1191p_j\right]a_{j+3} \\
&+ 2416p_ja_j + \left[\frac{12600}{h^5} + 1191p_j\right]a_{j+1} + \left[\frac{10080}{h^5} + 120p_j\right]a_{j+2} + \left[\frac{2520}{h^5} + p_j\right]a_{j+3} = f_j
\end{align*}$$

(14)
Or

\[ Ba = r \]  

where

\[
B = \begin{bmatrix} 1 & 120 & 191 & 2416 & 1191 & 120 & 1 & 0 & \cdots & 0 \\ -\frac{7}{h} & \frac{92}{h} & -\frac{1715}{h} & 0 & \frac{1715}{h} & \frac{92}{h} & \frac{7}{h} & 0 & \cdots & 0 \\ -\frac{42}{h^2} & \frac{1008}{h^2} & \frac{630}{h^2} & -\frac{3360}{h^2} & \frac{630}{h^2} & \frac{1008}{h^2} & \frac{42}{h^2} & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & \ldots & 0 & LB_{41}^{N+7} & LB_{42}^{N+7} & LB_{43}^{N+7} & LB_{44}^{N+7} & LB_{45}^{N+7} & LB_{46}^{N+7} & LB_{47}^{N+7} \end{bmatrix}
\]

\[ a = \left( a_{1,3}, a_{2,3}, \ldots, a_{N+1,3}, a_{N+2}, a_{N+3} \right)^T \]

\[ r = \left( y(c), y^{(1)}(c), y^{(2)}(c), f(x_0), f(x_1), \ldots, f(x_N), y(d), y^{(1)}(d), y^{(2)}(d) \right)^T \]

and

\[ LB_{4i,4k} = -\frac{2520}{h^5} + p_k, \quad LB_{4i,4k}^{N+7} = \frac{10080}{h^5} + 120p_k, \quad LB_{4i,3k}^{N+7} = -\frac{12600}{h^5} + 191p_k \]

\[ LB_{4i,4k} = 2416p_k, \quad LB_{4i,5k} = -\frac{12600}{h^5} + 191p_k, \quad LB_{4i,5k} = -\frac{10080}{h^5} + 120p_k \]

\[ LB_{4i,7k} = \frac{2520}{h^5} + p_k, \quad p_k = p(a + kh), \quad f_k = f(x_k), k = 0, 1, 2, \ldots, N \]

\( T \) denoting transpose.

In which \( B \) is a square matrix of order \( N + 7 \) with seven nonzero bands. Since \( B \) is nonsingular, after solving the linear system Equation (15) for \( a_{1,3}, a_{2,3}, \ldots, a_{N+1,3}, a_{N+2}, a_{N+3} \), we can obtain the septic spline approximate solution \( S(x) = \sum_{i=3}^{N+3} a_i \phi_i(x) \) with the accuracy being \( O(h^7) \).

### 3.2. Nonlinear Problems

Consider the nonlinear fifth order boundary value problem

\[ y^{(5)}(x) = F(x, y, y') \]  

with boundary conditions

\[ y(c) = \alpha_0, y^{(1)}(c) = \alpha_1, y^{(2)}(c) = \alpha_2, \]

\[ y(d) = \alpha_4, y^{(1)}(d) = \alpha_5, y^{(2)}(d) = \alpha_5 \]  

We use the quesilinearization technique to reduce the above nonlinear problem to a sequence of linear problems. Expanding the right hand side of Equation (16), we have
\[
\begin{align*}
\left( y^{(5)} \right)_{k+1} &= F(x, y, y') - F(y_k, (y')_k) + \frac{\partial F}{\partial y'} \left( y_{k+1} - y_k \right) + \frac{\partial F}{\partial y'} \left( (y')_{k+1} - (y')_k \right) \\
\end{align*}
\] (18)

Equation (18) can be rewritten as
\[
y^{(5)}_{k+1} + q_k(x) y^{(1)}_{k+1} + p_k(x) y_{k+1} = f_k(x), \quad c < x < d
\] (19)

where
\[
q_k(x) = -\left( \frac{\partial F}{\partial y'} \right)_{(x,y)}, \quad p_k(x) = -\left( \frac{\partial F}{\partial y} \right)_{(x,y)}
\]
\[
f_k(x) = F\left( y_k, (y')_k \right) - \left( \frac{\partial F}{\partial y'} \right)_{(x,y)} y_k - \left( \frac{\partial F}{\partial y} \right)_{(x,y)} (y')_k
\]

Equation (19) once the initial values \( k = 0, q_k(x), p_k(x), f_k(x) \) has been computed from the initial conditions, Equation (19) becomes into a linear equations with constant coefficients. Equation (19) can be solved by using iterative method.

Subject to the boundary conditions
\[
y_{k+1}(c) = \alpha_0, y^{(1)}_{k+1}(c) = \alpha_1, y^{(2)}_{k+1}(c) = \alpha_2, \\
y_{k+1}(d) = \alpha_5, y^{(1)}_{k+1}(d) = \alpha_4, y^{(2)}_{k+1}(d) = \alpha_5
\] (20)

Instead of solving nonlinear problem (16) with boundary conditions (17), we solve a sequence of linear problems (19) with boundary conditions (20), we consider \( y_{k+1}(x) \) as the numerical solution to nonlinear problem (16) with boundary conditions (17).

4. Computation of Error
The relative error of numerical solution is given by
\[
E' = \frac{\sum_{j=1}^{N} (S(x_j) - y(x_j))^2}{\sqrt{\sum_{j=1}^{N} y(x_j)^2}}
\] (21)

The pointwise errors are given by
\[
E(x_j) = \left| S(x_j) - y(x_j) \right|
\] (22)

The maximum pointwise errors are given by
\[
E^N = \max_{0 \leq j \leq N} \left| \frac{y(x_j) - S(x_j)}{y(x_j)} \right|
\] (23)

5. Numerical Tests
In the section, we illustrate the numerical techniques discussed in the previous section by the following problems.

**Example 1.** Consider the following equation [15]-[17]:
\[
y^{(5)}(x) - y(x) = f(x), \quad 0 \leq x \leq 1 \\
f(x) = -(15 + 10x)e^x
\]

With boundary conditions
\[
y(0) = 0, y^{(1)}(0) = 1, y^{(2)}(0) = 0, \\
y(1) = 0, y^{(1)}(1) = -e, y^{(2)}(1) = -4e
\]
The exact solution is given by

\[ y(x) = x(1-x)e^x \]

The numerical results are shown in Table 2, the comparison of maximum absolute errors are given by Table 3. The relative errors for different values of \( h \) are seen in Figure 1. The pointwise errors of example are given in Figure 2. The maximum pointwise errors for different values of \( h \) are given in Figure 3.

**Example 2.** Consider the following nonlinear equation [15] [18] [19].

6. Conclusion

In the paper, the fifth-order boundary value problems are solved by means of septic B-splines collocation method. We use the quasilinearization technique to reduce the nonlinear problems to linear problems and reduce a boundary value problem to the solution of algebraic equations with seven nonzero bands. The numerical results show that the present method is relatively simple to collocate the solution at the mesh points and easily carried out by a computer and approximates the exact solution very well.
