Abstract
In this paper, we obtain explicit formulae for the number of 7-cycles and the total number of cycles of lengths 6 and 7 which contain a specific vertex \( v_i \) in a simple graph \( G \), in terms of the adjacency matrix and with the help of combinatorics.

Keywords
Adjacency Matrix, Cycle, Graph Theory, Path, Subgraph, Walk

1. Introduction
In a simple graph \( G \), a walk is a sequence of vertices and edges of the form \( v_0, e_1, v_1, \ldots, e_k, v_k \) such that the edge \( e_i \) has ends \( v_{i-1} \) and \( v_i \). A walk is called closed if \( v_0 = v_k \). In graph theory, a path in a graph is a finite or infinite sequence of edges which connect a sequence of vertices which, are all distinct from one another. A closed path (with the common end points) is called a cycle.

It is known that if a graph \( G \) has adjacency matrix \( A = [a_{ij}] \), then for \( k = 0,1, \ldots \), the \( ij \)-entry of \( A^k \) is the number of \( v_i - v_j \) walks of length \( k \) in \( G \). It is also known that \( tr(A^k) \) is the sum of the diagonal entries of \( A^k \) and \( d_i \) is the degree of the vertex \( v_i \).

In 1971, Frank Harary and Bennet Manvel [1], gave formulae for the number of cycles of lengths 3 and 4 in simple graphs as given by the following theorems:

**Theorem 1.** [1] If \( G \) is a simple graph with adjacency matrix \( A = [a_{ij}] \), for \( k = 0,1, \ldots \), the \( ij \)-entry of \( A^k \) is the number of \( v_i - v_j \) walks of length \( k \) in \( G \). It is also known that \( tr(A^k) \) is the sum of the diagonal entries of \( A^k \) and \( d_i \) is the degree of the vertex \( v_i \).

**Theorem 2.** [1] If \( G \) is a simple graph with adjacency matrix \( A = [a_{ij}] \), then the number of 4-cycles in \( G \) is
\[
\frac{1}{8} tr(A^4) - 2q - 2\sum_{j,i} d_{ij}^{(2)},
\]
where \( q \) is the number of edges in \( G \). (It is obvious that the above formula is also

How to cite this paper: Movarraei, N. and Boxwala, S.A. (2016) On the Number of Cycles in a Graph. Open Journal of Discrete Mathematics, 6, 41-69. http://dx.doi.org/10.4236/ojdm.2016.62005
equal to \( \frac{1}{8} \left( trA^4 - trA^2 - 2\sum_{j=1}^{n} d_{ij}^{(2)} \right) \)

**Theorem 3.** [1] If \( G \) is a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \), then the number of 5-cycles in \( G \) is

\[
\frac{1}{10} \left[ tr(A^5) + 5 tr(A^4) - 5 \sum_{i=1}^{n} d_{ii} a_{i}^{(5)} \right]
\]

In 2003, V. C. Chang and H. L. Fu [2], found a formula for the number of 6-cycles in a simple graph which is stated below:

**Theorem 4.** [2] If \( G \) is a simple graph with adjacency matrix \( A \), then the number of 6-cycles in \( G \) is

\[
\frac{1}{12} \left[ tr(A^6) - 6 tr(A^4) + 5 tr(A^3) - 3 \sum_{i,j=1}^{n} a_{ij}^{(4)} + 12 \sum_{i,j=1}^{n} a_{ij}^{(2)} - 3 \sum_{i,j=1}^{n} a_{ij}^{(3)} \right]^2 + 9 \sum_{i,j=1}^{n} a_{ij}^{(2)} \left( a_{ij}^{(2)} - 1 \right) a_{ij}
\]

\[
-6 \sum_{i,j=1}^{n} a_{ij}^{(2)} \left( a_{ij}^{(2)} - 1 \right) \left( a_{ij}^{(2)} - 2 \right) - 2 \sum_{i,j=1}^{n} a_{ij}^{(2)} \left( a_{ij}^{(2)} - 1 \right) \left( a_{ij}^{(2)} - 2 \right),
\]

where \( p \) is the number of vertices in \( G \).

Their proofs are based on the following fact:

The number of \( n \)-cycles (\( n = 3, 4, 5, 6 \)) in a graph \( G \) is equal to \( \frac{1}{2n} \left( tr(A^n) - x \right) \) where \( x \) is the number of closed walks of length \( n \), which are not \( n \)-cycles.

In 1997, N. Alon, R. Yuster and U. Zwick [3], gave number of 7-cyclic graphs. They also gave some formulae for the number of cycles of lengths 5, which contains a specific vertex \( v_i \) in a graph \( G \).

In [3]-[9], we have also some bounds to estimate the total time complexity for finding or counting paths and cycles in a graph.

In our recent works [10], we obtained some formulae to find the exact number of paths of lengths 3, 4 and 5, in a simple graph \( G \), given below:

**Theorem 5.** [11] Let \( G \) be a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \). The number of paths of length 3 in \( G \) is \( \sum a_{ij}^{(2)} (d_{i} - a_{j} - 1) \).

**Theorem 6.** [11] Let \( G \) be a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \). The number of paths of length 4 in \( G \) is \( \sum a_{ij}^{(4)} - 2a_{ij}^{(2)} (d_{i} - a_{j}) \).\n
**Theorem 7.** [11] Let \( G \) be a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \). The number of paths of length 3 in \( G \), each of which starts from a specific vertex \( v_i \) is \( \sum a_{ij}^{(2)} (d_{i} - a_{j} - 1) \).

**Theorem 8.** [11] Let \( G \) be a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \). The number of paths of length 4 in \( G \), each of which starts from a specific vertex \( v_i \) is \( \sum a_{ij}^{(4)} - (d_{i} + d_{j} - 3a_{ij}) a_{ij}^{(2)} - \left( a_{ij}^{(4)} + a_{ij}^{(2)} + 2 \left( d_{j} - 1 \right) \right) a_{ij} \).

**Theorem 9.** [10] Let \( G \) be a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \). The number of paths of length 5 in \( G \) is \( \sum a_{ij}^{(5)} - 2 \sum a_{ij}^{(4)} + 2 \sum a_{ij}^{(3)} (d_{i} - 2) + 4 \sum a_{ij}^{(2)} - 2 \sum a_{ij}^{(2)} (d_{j} - a_{j} - 1) \)

\[
-4 \sum a_{ij}^{(2)} \left( d_{i} - a_{j} - 1 \right) + 6 \sum a_{ij}^{(2)} \left( d_{j} - 2 \right) - 2 \sum a_{ij}^{(3)} a_{ij}^{(2)} - 2 \sum a_{ij}^{(3)} \left( d_{j} - 2 \right)
\]

\[
-2 \sum \left( a_{ij}^{(2)} - a_{ij}^{(2)} - 2 \left( d_{j} - 2 \right) \right) a_{ij}^{(2)} = -3 \frac{trA^{4}}{4} + 6 \frac{trA^{3}}{4} + 3 \frac{trA^{2}}{4}.
\]

**Theorem 10.** [10] If \( G \) is a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \), then the number
of 4-cycles each of which contains a specific vertex \( v_i \) of \( G \) is
\[
\frac{1}{2} \left[ a_{ij}^{(4)} - a_{ij}^{(2)} - 2 \left( \frac{d_i}{2} \right) \sum_{j=1, j \neq i} a_{ij}^{(2)} \right].
\]

In [3] we can also see a formula for the number of 5-cycles each of which contains a specific vertex \( v_i \) but, their formula has some problem in coefficients. In [12] we gave the correct formula as considered below:

**Theorem 11.** [12] If \( G \) is a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \), then the number of 5-cycles each of which contains a specific vertex \( v_i \) of \( G \) is
\[
\frac{1}{2} \left[ a_{ij}^{(5)} - 5a_{ij}^{(3)} - 2(d_i - 2)a_{ij}^{(2)} - 2 \sum_{j=1, j \neq i} a_{ij}^{(2)} a_{ij} \left( d_j - 2 \right) - 2 \sum_{j=1, j \neq i} a_{ij} \left( \frac{1}{2} a_{ij}^{(3)} - a_{ij} a_{ij}^{(2)} \right) \right].
\]

In this paper, we give a formula to count the exact number of cycles of length 7 and the number of cycles of lengths 6 and 7 containing a specific vertex \( v_i \) in a simple graph \( G \), in terms of the adjacency matrix of \( G \) and with the help of combinatorics.

### 2. Number of 7-Cycles

In 1997, N. Alon, R. Yuster and U. Zwick [3], gave number of 7-cyclic graphs. The \( n \)-cyclic graph is a graph that contains a closed walk of length \( n \) and these walks are not necessarily cycles. In this section we obtain a formula for the number of cycles of length 7 in a simple graph \( G \) with the helps of [3].

**Method:** To count \( N \) in the cases considered below, we first count \( tr(A^7) \) for the graph of first configuration. This will give us the number of all closed walks of length 7 in the corresponding graph. But, some of these walks do not pass through all the edges and vertices of that configuration and to find \( N \) in each case, we have to include in any walk, all the edges and the vertices of the corresponding subgraphs at least once. So, we delete the number of closed walks of length 7 which do not pass through all the edges and vertices. To find these kind of walks we also have to count \( tr(A^7) \) for all the subgraphs of the corresponding graph that can contain a closed walk of length 7.

**Theorem 12.** If \( G \) is a simple graph with \( n \) vertices and the adjacency matrix \( A = [a_{ij}] \), then the number of 7-cycles in \( G \) is
\[
\frac{1}{14} \left( tr(A^7) - x \right),
\]
where \( x \) is equal to \( \sum_{i=1}^{11} F_i \) in the cases that are considered below.

**Proof:** The number of 7-cycles of a graph \( G \) is equal to \( \frac{1}{14} \left( tr(A^7) - x \right) \), where \( x \) is the number of closed walks of length 7 that are not 7-cycles. To find \( x \), we have 11 cases as considered below; the cases are based on the configurations (subgraphs) that generate all closed walks of length 7 that are not 7-cycles.

In each case, \( N \) denotes the number of closed walks of length 7 that are not 7-cycles in the corresponding subgraph, \( M \) denotes the number of subgraphs of \( G \) of the same configuration and \( F_n \) \((n = 1, 2, \ldots)\) denote the total number of closed walks of length 7 that are not cycles in all possible subgraphs of \( G \) of the same configurations. However, in the cases with more than one figure (Cases 5, 6, 8, 9, 11), \( N, M \) and \( F_n \) are based on the first graph in case \( n \) of the respective figures and \( P_1, P_2, \ldots \) denote the number of subgraphs of \( G \) which don’t have the same configuration as the first graph but are counted in \( M \). It is clear that \( F_n \) is equal to \( N \times (M - P_1 - P_2 - \cdots) \). To find \( N \) in each case, we have to include in any walk, all the edges and the vertices of the corresponding subgraphs at least once.

**Case 1:** For the configuration of Figure 1, \( N = 126 \), \( M = \frac{1}{6} tr(A^7) \) and \( F_1 = 21 tr(A^7) \). (See Theorem 1)

![Figure 1. Closed walks of length 7 type 1.](image)
Case 2: For the configuration of Figure 2, \( N = 84 \), \( M = \frac{1}{2} \sum_{i=1}^{n} d_i^{(3)} (d_i - 2) \) and \( F_2 = 42 \sum_{i=1}^{n} d_i^{(3)} (d_i - 2) \).

![Figure 2. Closed walks of length 7 type 2.](image)

Case 3: For the configuration of Figure 3, \( N = 28 \), \( M = \frac{1}{2} \sum_{i=1}^{n} d_i^{(3)} (d_i - 2) \) and \( F_3 = 14 \sum_{i=1}^{n} d_i^{(3)} (d_i - 2) \).

![Figure 3. Closed walks of length 7 type 3.](image)

Case 4: For the configuration of Figure 4, \( N = 112 \), \( M = \frac{1}{2} \sum_{i=1}^{n} \left( d_i^{(2)} \right)^2 \) and \( F_4 = 56 \sum_{i=1}^{n} \left( d_i^{(2)} \right)^2 \).

![Figure 4. Closed walks of length 7 type 4.](image)

Case 5: For the configuration of Figure 5(a), \( N = 14 \), \( M = \frac{1}{2} \sum_{i=1}^{n} a_i^{(3)} a_y^{(2)} \). Let \( P_1 \) denote the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 5(b) and are counted in \( M \). Thus \( P_1 = 6 \times \left( \frac{1}{126} F_1 \right) \), where \( \frac{1}{126} F_1 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 5(b) and 6 is the number of times that this subgraph is counted in \( M \). Let \( P_2 \) denote the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 5(c) and are counted in \( M \). Thus \( P_2 = 2 \times \left( \frac{1}{84} F_2 \right) \), where \( \frac{1}{84} F_2 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 5(c) and 2 is the number of times that this subgraph is counted in \( M \). Let \( P_3 \) denote the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 5(d) and are counted in \( M \). Thus \( P_3 = 4 \times \left( \frac{1}{112} F_3 \right) \), where \( \frac{1}{112} F_3 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 5(d) and 4 is the number of times that this subgraph is counted in \( M \). Consequently, \( F_5 = 7 \sum_{j=1}^{n} a_i^{(3)} a_y^{(2)} - \frac{2}{3} F_1 - \frac{1}{3} F_2 - \frac{1}{2} F_4 \).
Case 6: For the configuration of Figure 6(a), \( N = 14 \), \( M = \frac{1}{2} \sum_{j \neq i} a_{ij}^{(2)} a_{ij} (d_j - 2)(d_i - 2) \). Let \( P_i \) denote the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 6(b) and are counted in \( M \). Thus \( P_i = 2 \times \left( \frac{1}{112} F_4 \right) \), where \( \frac{1}{112} F_4 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 6(b) and 2 is the number of times that this subgraph is counted in \( M \). Consequently, \( F_6 = 7 \sum_{j \neq i} a_{ij}^{(2)} a_{ij} (d_j - 2)(d_i - 2) - \frac{1}{4} F_4 \).

Case 7: For the configuration of Figure 7, \( N = 70 \), \( M = \frac{1}{10} \left[ \text{tr} \left( A^5 \right) + 5 \text{tr} \left( A^3 \right) - 5 \sum_{j < i} d_{ij} a_{ij}^{(3)} \right] \) (see Theorem 3) and \( F_7 = 7 \text{tr} \left( A^5 \right) + 35 \text{tr} \left( A^3 \right) - 35 \sum_{j < i} d_{ij} a_{ij}^{(3)} \).

Case 8: For the configuration of Figure 8(a), \( N = 42 \), \( M = \frac{1}{2} \sum_{j \neq i} a_{ij}^{(2)} (d_j - 2)(d_i - 1)(a_{ij} a_{ij}^{(2)}) \) (see Theorem 5). Let \( P_i \) denote the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 8(b) and are counted in \( M \). Thus \( P_i = 4 \times \left( \frac{1}{112} F_4 \right) \), where \( \frac{1}{112} F_4 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 8(b) and 4 is the number of times that this subgraph is counted in \( M \).
Consequently, \( F_s = 21 \sum_{j=1}^{n} a_{ij}^{(2)} (d_j - a_{ij} - 1)(a_{ij} - a_{ij}^{(2)}) - \frac{3}{2} F_4 \).

**Figure 8.** Closed walks of length 7 type 8.

**Case 9:** For the configuration of Figure 9(a), \( N = 14 \),
\[
M = \frac{1}{2} \left[ \sum_{i=1}^{n} \left( a_{ii}^{(5)} - 5a_{ii}^{(3)} - 2(d_i - 2)a_{ii}^{(3)} \right)(d_i - 2) - 2 \sum_{j=1}^{n} a_{ij}(d_j - 2) - 2 \sum_{j=1}^{n} a_{ji}(d_i - 2) \left( \frac{1}{2} a_{ij}^{(3)} - a_{ij} a_{ij}^{(2)} \right) \right]
\]
(see Theorem 11). Let \( P_i \) denote the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 9(b) and are counted in \( M \). Thus
\[ P_i = 2 \times \left( \frac{1}{42} F_s \right), \quad \text{where} \quad \frac{1}{42} F_s \quad \text{is the number subgraphs of} \ G \text{that have the same configuration as the graph of Figure 9(b) and} \ 2 \text{ is the number of times that this subgraph is counted in} \ M. \text{Consequently,}
\[
F_q = 7 \sum_{i=1}^{n} \left( a_{ii}^{(5)} - 5a_{ii}^{(3)} - 2(d_i - 2)a_{ii}^{(3)} \right)(d_i - 2) - 14 \sum_{j=1}^{n} a_{ij}(d_j - 2)(d_i - 2)
- 14 \sum_{j=1}^{n} a_{ji}(d_i - 2) \left( \frac{1}{2} a_{ij}^{(3)} - a_{ij} a_{ij}^{(2)} \right) - \frac{2}{3} F_s
\]

**Figure 9.** Closed walks of length 7 type 9.

**Case 10:** For the configuration of Figure 10, \( N = 84 \),
\[
M = \frac{1}{2} \sum_{j=1}^{n} \left( a_{ij}^{(2)} \right) a_{ij} \quad \text{and} \quad F_{10} = 42 \sum_{j=1}^{n} \left( \frac{1}{3} a_{ij}^{(2)} \right) a_{ij}.
\]

**Figure 10.** Closed walks of length 7 type 10.
Case 11: For the configuration of Figure 11(a), $N = 28$, $M = \frac{1}{2} \sum_{i=1}^{17} \left( \frac{d_{yi}^{(2)}}{2} \right) a_{yi}^{(3)}$. Let $P_1$ denote the number of subgraphs of $G$ that have the same configuration as the graph of Figure 11(b) and are counted in $M$. Thus $P_1 = 2 \times \left( \frac{1}{42} F_8 \right)$, where $\frac{1}{42} F_8$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 11(b) and 2 is the number of times that this subgraph is counted in $M$. Let $P_2$ denote the number of subgraphs of $G$ that have the same configuration as the graph of Figure 11(c) and are counted in $M$. Thus $P_2 = 6 \times \left( \frac{1}{112} F_4 \right)$, where $\frac{1}{112} F_4$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 11(c) and 6 is the number of times that this subgraph is counted in $M$. Let $P_3$ denote the number of subgraphs of $G$ that have the same configuration as the graph of Figure 11(d) and are counted in $M$. Thus $P_3 = 6 \times \left( \frac{1}{84} F_{10} \right)$, where $\frac{1}{84} F_{10}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 11(d) and 6 is the number of times that this subgraph is counted in $M$. Consequently, $F_{11} = 14 \sum_{j=1}^{17} \left( \frac{d_{yi}^{(2)}}{2} \right) a_{yi}^{(3)} - \frac{4}{3} F_8 - \frac{3}{2} F_4 - 2 F_{10}$.

![Figure 11. Closed walks of length 7 type 11.](image)

Now, we add the values of $F_n$ arising from the above cases and determine $x$. By putting the value of $x$ in $\frac{1}{14} \left( tr(A^r) - x \right)$ we get the desired formula. \qed

Example 1. In $K_7$, $F_1 = 4410$, $F_2 = 35280$, $F_3 = 17640$, $F_4 = 23520$, $F_5 = 17640$, $F_6 = 17640$, $F_7 = 17640$, $F_8 = 52920$, $F_9 = 35280$, $F_{10} = 17640$, $F_{11} = 35280$ and $trA^r = 279930$. So $x = 274890$ and by Theorem 12, the number of cycles of length 7 in $K_7$ is $\frac{1}{14} (279930 - 274890) = 360$.

3. Number of Cycles Passing the Vertex $v_i$

In this section we give formulae to count the number of cycles of lengths 6 and 7, each of which contain a specific vertex $v_i$ of the graph $G$.

Theorem 13. If $G$ is a simple graph with $n$ vertices and the adjacency matrix $A = \left[ a_{yi} \right]$, then the number of 6-cycles each of which contains a specific vertex $v_i$ of $G$ is $\frac{1}{2} \left( a_{vi}^{(6)} - x \right)$, where $x$ is equal to $\sum_{i=1}^{17} F_i$ in the cases that are considered below.

Proof: The number of 6-cycles each of which contain a specific vertex $v_i$ of the graph $G$ is equal to $\frac{1}{2} \left( a_{vi}^{(6)} - x \right)$, where $x$ is the number of closed walks of length 6 form the vertex $v_i$ to $v_j$ that are not 6-cycles. To find $x$, we have 17 cases as considered below; the cases are based on the configurations-(subgraphs) that...
generate \( v_i - v_j \) walks of length 6 that are not cycles. In each case, \( N \) denotes the number of walks of length 6 from \( v_i \) to \( v_j \) that are not cycles in the corresponding subgraph, \( M \) denotes the number of subgraphs of \( G \) of the same configuration and \( F_n \), \( (n=1,2,\cdots) \) denote the total number of \( v_i - v_j \) walks of length 6 that are not cycles in all possible subgraphs of \( G \) of the same configuration. However, in the cases with more than one figure (Cases 11, 12, 13, 14, 15, 16, 17), \( N \), \( M \) and \( F_n \) are based on the first graph of the respective figures and \( P_1, P_2, \cdots \) denote the number of subgraphs of \( G \) which don’t have the same configuration as the first graph but are counted in \( M \). It is clear that \( F_n \) is equal to \( N \times (M - P_1 - P_2 - \cdots) \). To find \( N \) in each case, we have to include in any walk, all the edges and the vertices of the corresponding subgraphs at least once.

**Case 1:** For the configuration of Figure 12, \( N = 1 \), \( M = a_0^{(2)} \) and \( F_1 = a_0^{(2)} \).

![Figure 12. \( v_i - v_i \) walks of length 6 type 1.](image)

**Case 2:** For the configuration of Figure 13, \( N = 3 \), \( M = \sum_{j=0} a_j^{(2)} \) and \( F_2 = 3 \sum_{j=0} a_j^{(2)} \).

![Figure 13. \( v_i - v_i \) walks of length 6 type 2.](image)

**Case 3:** For the configuration of Figure 14, \( N = 6 \), \( M = \binom{d_i}{2} \) and \( F_3 = 6 \binom{d_i}{2} \).

![Figure 14. \( v_i - v_i \) walks of length 6 type 3.](image)

**Case 4:** For the configuration of Figure 15, \( N = 1 \), \( M = \sum_{j=0} a_j^{(2)} (d_j - a_j - 1) \) and \( F_4 = \sum_{j=0} a_j^{(2)} (d_j - a_j - 1) \).

(See Theorem 7)

![Figure 15. \( v_i - v_i \) walks of length 6 type 4.](image)

**Case 5:** For the configuration of Figure 16, \( N = 2 \), \( M = \sum_{j=0} a_j^{(2)} (d_j - a_j - 1) \) and \( F_5 = 2 \sum_{j=0} a_j^{(2)} (d_j - a_j - 1) \).

![Figure 16. \( v_i - v_i \) walks of length 6 type 5.](image)

**Case 6:** For the configuration of Figure 17, \( N = 2 \), \( M = \sum_{j=0} a_j^{(2)} \binom{d_j - 1}{2} \) and \( F_6 = 2 \sum_{j=0} a_j^{(2)} \binom{d_j - 1}{2} \).

![Figure 17. \( v_i - v_i \) walks of length 6 type 6.](image)
Case 7: For the configuration of Figure 18, $N = 6$, $M = \left(\frac{d_i}{3}\right)$ and $F_7 = 6\left(\frac{d_i}{3}\right)$.

Case 8: For the configuration of Figure 19, $N = 8$, $M = \frac{1}{2} \sum_{j \in i} a_{ij}^{(2)} a_{ji}$ and $F_8 = 4 \sum_{j \in i} a_{ij}^{(2)} a_{ji}$.

Case 9: For the configuration of Figure 20, $N = 12$, $M = \sum_{j \in i} \left(\frac{a_{ij}^{(2)}}{2}\right)$ and $F_9 = 12 \sum_{j \in i} \left(\frac{a_{ij}^{(2)}}{2}\right)$.

Case 10: For the configuration of Figure 21, $N = 12$, $M = \sum_{j \in i} \left(\frac{a_{ij}^{(2)}}{2}\right) a_{ji}$ and $F_{10} = 12 \sum_{j \in i} \left(\frac{a_{ij}^{(2)}}{2}\right) a_{ji}$.
Figure 21. $v_i - v_j$ walks of length 6 type 10.

**Case 11:** For the configuration of Figure 22(a), $N = 6$, $M = \frac{1}{2} \sum_{k \neq j, j, k \neq i} a_{jk}a_{ji}a_{ik}$. Let $P_i$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 22(b) and are counted in $M$. Thus $P_i = 1 \times \left(\frac{1}{8}F_k\right)$, where $\frac{1}{8}F_k$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 22(b) and this subgraph is counted only once in $M$. Consequently, $F_{11} = 3 \sum_{k \neq j, j, k \neq i} a_{jk}a_{ji}a_{ik} - \frac{3}{4}F_k$.

Figure 22. $v_i - v_j$ walks of length 6 type 11.

**Case 12:** For the configuration of Figure 23(a), $N = 2$, $M = \sum_{k \neq j, j, k \neq i} \left(\frac{a_{jk}}{2}\right) a_y$. Let $P_i$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 23(b) and are counted in $M$. Thus $P_i = 2 \times \left(\frac{1}{12}F_g\right)$, where $\frac{1}{12}F_g$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 23(b) and 2 is the number of times that this subgraph is counted in $M$. Consequently, $F_{12} = 2 \sum_{k \neq j, j, k \neq i} \left(\frac{a_{jk}}{2}\right) a_y - \frac{1}{3}F_g$.

Figure 23. $v_i - v_j$ walks of length 6 type 12.
Case 13: For the configuration of Figure 24(a), \( N = 4 \), \( M = \sum_{j=1}^{2} \left( \frac{a_{ij}^{(2)}}{2} \right)(d_{j} - 2) \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 24(b) and are counted in \( M \). Thus \( P_1 = 1 \times \left( \frac{1}{12} F_{10} \right) \), where \( \frac{1}{12} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 24(b) and this subgraph is counted only once in \( M \). Consequently, \( F_{13} = 4 \sum_{j=1}^{2} \left( \frac{a_{ij}^{(2)}}{2} \right)(d_{j} - 2) - \frac{1}{3} F_{10} \).

![Figure 24](image)

Case 14: For the configuration of Figure 25(a), \( N = 2 \), \( M = \sum_{j=1}^{2} \left( \frac{a_{ij}^{(2)}}{2} \right)(d_{j} - 2) \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 25(b) and are counted in \( M \). Thus \( P_1 = 1 \times \left( \frac{1}{12} F_{10} \right) \), where \( \frac{1}{12} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 25(b) and this subgraph is counted only once in \( M \). Consequently, \( F_{14} = 2 \sum_{j=1}^{2} \left( \frac{a_{ij}^{(2)}}{2} \right)(d_{j} - 2) - \frac{1}{6} F_{10} \).

![Figure 25](image)

Case 15: For the configuration of Figure 26(a), \( N = 2 \), \( M = \sum_{j=1}^{2} \left( d_{j} - a_{ij} - 1 \right)a_{ij}(d_{j} - 2) \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 26(b) and are counted in \( M \). Thus \( P_1 = 2 \times \left( \frac{1}{6} F_{11} \right) \), where \( \frac{1}{6} F_{11} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 26(b) and 2 is the number of times that this subgraph is counted in \( M \).
Consequently, \( F_{15} = 2 \sum_{j \neq i} a_{ij}^{(2)} (d_j - a_j - 1) a_{ji} (d_j - 2) - \frac{2}{3} F_{11} \).

**Figure 26.** \( v_i - v_i \) walks of length 6 type 15.

**Case 16:** For the configuration of Figure 27(a), \( N = 4 \), \( M = \frac{1}{2} \sum_{j \neq i} a_{ij}^{(3)} a_{ji}^{(2)} a_j \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 27(b) and are counted in \( M \). Thus \( P_1 = 2 \times \left( \frac{1}{8} F_8 \right) \), where \( \frac{1}{8} F_8 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 27(b) and 2 is the number of times that this subgraph is counted in \( M \). Let \( P_2 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 27(c) and are counted in \( M \). Thus \( P_2 = 2 \times \left( \frac{1}{6} F_{11} \right) \), where \( \frac{1}{6} F_{11} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 27(c) and 2 is the number of times that this subgraph is counted in \( M \). Let \( P_3 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 27(d) and are counted in \( M \). Thus \( P_3 = 2 \times \left( \frac{1}{12} F_{10} \right) \), where \( \frac{1}{12} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 27(d) and 2 is the number of times that this subgraph is counted in \( M \). Consequently, \( F_{16} = 2 \sum_{j \neq i} a_{ij}^{(3)} a_{ji}^{(2)} a_j - \frac{4}{3} F_{11} - \frac{2}{3} F_{10} \).

**Figure 27.** \( v_i - v_i \) walks of length 6 type 16.

**Case 17:** For the configuration of Figure 28(a), \( N = 8 \), \( M = \frac{1}{2} a_{ij}^{(3)} \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 28(b) and are counted in \( M \). Thus
\[ P_i = 1 \times \left( \frac{1}{12} F_{10} \right), \] where \( \frac{1}{12} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 28(b) and this subgraph is counted only once in \( M \). Consequently, \( F_{17} = 8 \left( \frac{1}{2} a^{(3)}_u \right) - \frac{2}{3} F_{10} .\]

**Figure 28.** \( v_i - v_j \) walks of length 6 type 17.

Now we add the values of \( F_n \) arising from the above cases and determine \( x \). Substituting the value of \( x \) in
\[ \frac{1}{2} \left( a^{(6)}_u - x \right) \] and simplifying, we get the number of 6-cycles each of which contains a specific vertex \( v_i \) of \( G \). □

**Example 2.** In the graph of Figure 29 we have, \( F_1 = 5, \ F_2 = 60, \ F_3 = 60, \ F_4 = 60, \ F_5 = 120, \ F_6 = 60, \ F_7 = 60, \ F_8 = 80, \ F_9 = 360, \ F_{10} = 360, \ F_{11} = 180, \ F_{12} = 120, \ F_{13} = 240, \ F_{14} = 120, \ F_{15} = 240, \ F_{16} = 240, \ F_{17} = 120 \). So, we have \( x = 2485 \). Consequently, by Theorem 13, the number of 6-cycles each of which contains the vertex \( v_i \) in the graph of Figure 29 is 60.

**Figure 29.** Complete graph with 7 vertices.

**Theorem 14.** If \( G \) is a simple graph with \( n \) vertices and the adjacency matrix \( A = \left[ a_{ij} \right] \), then the number of 7-cycles each of which contains a specific vertex \( v_i \) of \( G \) is 
\[ \frac{1}{2} \left( a^{(7)}_u - x \right) , \] where \( x \) is equal to \( \sum_{i=1}^{30} F_i \) in the cases that are considered below.

**Proof:** The number of 7-cycles each of which contains a specific vertex \( v_i \) of the graph \( G \) is equal to 
\[ \frac{1}{2} \left( a^{(7)}_u - x \right) , \] where \( x \) is the number of closed walks of length 7 form the vertex \( v_i \) to \( v_i \) that are not 7-cycles. To find \( x \), we have 30 cases as considered below; the cases are based on the configurations-(subgraphs) that generate \( v_i - v_j \) walks of length 7 that are not cycles. In each case, \( N \) denotes the number of walks of length 7 from \( v_i \) to \( v_i \) that are not cycles in the corresponding subgraph, \( M \) denotes the number of subgraphs of \( G \) of the same configuration and \( F_n \), \( (n = 1, 2, \ldots) \) denote the total number of \( v_i - v_j \) walks of length 7 that are not cycles in all possible subgraphs of \( G \) of the same configuration. However, in the cases with more than one figure (Cases 9, 10, 18, 20, 30), \( N, M \) and \( F_n \) are based on the first graph of the respective figures and \( P_1, P_2, \ldots \) denote the number of subgraphs of \( G \) which do not have the same configuration as the first graph but are counted in \( M \). It is clear that \( F_n \) is equal to \( N \times (M - P_1 - P_2 - \cdots) \). To find \( N \) in each case, we have to
include in any walk, all the edges and the vertices of the corresponding subgraphs at least once.

**Case 1:** For the configuration of Figure 30,  \( N = 42 \), \( M = \frac{1}{2} \sum_{j \in i} d_y^{(2)} a_y \) and \( F_i = 2 \sum_{j \in i} a_y^{(2)} a_y \).

![Figure 30. \( v_i - v_i \) walks of length 7 type 1.](image)

**Case 2:** For the configuration of Figure 31,  \( N = 34 \), \( M = \frac{1}{2} d_y^{(3)} (d_i - 2) \) and \( F_i = 17 a_y^{(3)} (d_i - 2) \).

![Figure 31. \( v_i - v_i \) walks of length 7 type 2.](image)

**Case 3:** For the configuration of Figure 32,  \( N = 18 \), \( M = \sum_{j \in i} d_y^{(2)} a_y (d_j - 2) \) and \( F_i = 18 \sum_{j \in i} a_y^{(2)} a_y (d_j - 2) \).

![Figure 32. \( v_i - v_i \) walks of length 7 type 3.](image)

**Case 4:** For the configuration of Figure 33,  \( N = 4 \), \( M = \sum_{j \in i} \left( \frac{1}{2} d_y^{(3)} a_y - d_y^{(2)} a_y \right) (d_j - 3) \) and \( F_i = 4 \sum_{j \in i} \left( \frac{1}{2} a_y^{(3)} a_y - a_y^{(2)} a_y \right) (d_j - 3) \).

![Figure 33. \( v_i - v_i \) walks of length 7 type 4.](image)
Case 5: For the configuration of Figure 34, \( N = 12 \), \( M = \frac{1}{2} a^{(3)}_y \left( d_i - \frac{2}{2} \right) \) and \( F_s = 6a^{(3)}_y \left( \frac{d_i}{2} - \frac{2}{2} \right) \).

\[ d_{Ma} = \begin{cases} \sum_{i} \end{cases} \]

\[ d_{Fa} = \begin{cases} \sum_{i} \end{cases} \]

Figure 34. \( v_i - v_i \) walks of length 7 type 5.

Case 6: For the configuration of Figure 35, \( N = 4 \), \( M = \sum_{j} a^{(2)}_y d_j \left( \frac{d_i}{2} - \frac{2}{2} \right) \) and \( F_s = 4\sum_{j} a^{(2)}_y d_j \left( \frac{d_i}{2} - \frac{2}{2} \right) \).

\[ d_{Ma} = \begin{cases} \sum_{i} \end{cases} \]

\[ d_{Fa} = \begin{cases} \sum_{i} \end{cases} \]

Figure 35. \( v_i - v_i \) walks of length 7 type 6.

Case 7: For the configuration of Figure 36, \( N = 32 \), \( M = \sum_{j} a^{(2)}_y d_j \left( \frac{d_i}{2} - \frac{2}{2} \right) \) and \( F_s = 32\sum_{j} a^{(2)}_y d_j \left( \frac{d_i}{2} - \frac{2}{2} \right) \).

\[ d_{Ma} = \begin{cases} \sum_{i} \end{cases} \]

\[ d_{Fa} = \begin{cases} \sum_{i} \end{cases} \]

Figure 36. \( v_i - v_i \) walks of length 7 type 7.

Case 8: For the configuration of Figure 37, \( N = 24 \), \( M = \sum_{j} a^{(2)}_y d_j \left( \frac{d_i}{3} - \frac{2}{3} \right) \) and \( F_s = 24\sum_{j} a^{(2)}_y d_j \left( \frac{d_i}{3} - \frac{2}{3} \right) \).

\[ d_{Ma} = \begin{cases} \sum_{i} \end{cases} \]

\[ d_{Fa} = \begin{cases} \sum_{i} \end{cases} \]

Figure 37. \( v_i - v_i \) walks of length 7 type 8.
**Case 9:** For the configuration of Figure 38(a), \( N = 12 \), \( M = \frac{1}{2} \sum_{k,v,j,k,v} \left( a_{jk}^{(2)} \right) a_{y_j} a_{y_k} \). Let \( P_i \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 38(b) and are counted in \( M \). Thus \( P_i = 1 \times \left( \frac{1}{24} F_{10} \right) \), where \( \frac{1}{24} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 38(b) and this subgraph is counted only once in \( M \). Consequently,
\[
F_9 = 6 \sum_{k,v,j,k,v} \left( a_{jk}^{(2)} \right) a_{y_j} a_{y_k} - \frac{1}{2} F_{10}.
\]

**Figure 38.** \( v_i - v_j \) walks of length 7 type 9.

**Case 10:** For the configuration of Figure 39(a), \( N = 24 \), \( M = \frac{1}{2} \sum_{k,v,j,k,v} a_{jk}^{(2)} a_{y_j} a_{y_k} a_{jk} \). Let \( P_i \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 39(b) and are counted in \( M \). Thus \( P_i = 1 \times \left( \frac{1}{42} F_i \right) \), where \( \frac{1}{42} F_i \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 39(b) and this subgraph is counted only once in \( M \). Consequently,
\[
F_{10} = 12 \sum_{k,v,j,k,v} a_{jk}^{(2)} a_{y_j} a_{y_k} a_{jk} - \frac{4}{7} F_i.
\]

**Figure 39.** \( v_i - v_j \) walks of length 7 type 10.

**Case 11:** For the configuration of Figure 40(a), \( N = 14 \), \( M = \frac{1}{2} \sum_{j,v} a_{ji}^{(3)} a_{y_j} \). Let \( P_i \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 40(b) and are counted in \( M \). Thus \( P_i = 2 \times \left( \frac{1}{42} F_i \right) \), where \( \frac{1}{42} F_i \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 40(b) and 2 is the number of times that this subgraph is counted in \( M \). Consequently,
\[ F_{11} = 7 \sum_{j \neq i} a_j^{(3)} a_{ij} - \frac{2}{3} F_1. \]

**Case 12:** For the configuration of Figure 41(a), \( N = 2 \), \( M = \frac{1}{2} \sum_{j \neq i} a_j^{(2)} a_{ij}^{(3)} \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 41(b) and are counted in \( M \). Thus \( P_1 = 2 \times \left( \frac{1}{42} F_1 \right) \), where \( \frac{1}{42} F_1 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 41(b) and \( 2 \) is the number of times that this subgraph is counted in \( M \). Let \( P_2 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 41(c) and are counted in \( M \). Thus \( P_2 = 2 \times \left( \frac{1}{14} F_{11} \right) \), where \( \frac{1}{14} F_{11} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 41(c) and \( 2 \) is the number of times that this subgraph is counted in \( M \). Let \( P_3 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 41(d) and are counted in \( M \). Thus \( P_3 = 2 \times \left( \frac{1}{32} F_7 \right) \), where \( \frac{1}{32} F_7 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 41(d) and \( 2 \) is the number of times that this subgraph is counted in \( M \). Consequently, \( F_{12} = \sum_{j \neq i} a_j^{(3)} a_{ij}^{(3)} - \frac{2}{21} F_1 - \frac{2}{7} F_{11} - \frac{1}{8} F_7 \).

**Case 13:** For the configuration of Figure 42(a), \( N = 4 \), \( M = \frac{1}{2} \sum_{j \neq i} a_j^{(3)} a_{ij} (d_i - 1) \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 42(b) and are counted in \( M \). Thus \( P_1 = 2 \times \left( \frac{1}{42} F_1 \right) \), where \( \frac{1}{42} F_1 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 42(b) and \( 2 \) is the number of times that this subgraph is counted in \( M \). Let \( P_2 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 42(c) and are counted in \( M \). Thus \( P_2 = 2 \times \left( \frac{1}{14} F_{11} \right) \), where \( \frac{1}{14} F_{11} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 42(c) and \( 2 \) is the number of times that this subgraph is counted in \( M \). Let \( P_3 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 42(d) and are counted in \( M \). Thus \( P_3 = 2 \times \left( \frac{1}{32} F_7 \right) \), where \( \frac{1}{32} F_7 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 42(d) and \( 2 \) is the number of times that this subgraph is counted in \( M \). Consequently, \( F_{13} = \sum_{j \neq i} a_j^{(3)} a_{ij} (d_i - 1) - \frac{2}{21} F_1 - \frac{2}{7} F_{11} - \frac{1}{8} F_7 \).
counted in $M$. Thus $P_2 = 2 \times \left( \frac{1}{34} F_2 \right)$, where $\frac{1}{34} F_2$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 42(c) and 2 is the number of times that this subgraph is counted in $M$. Let $P_i$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 42(d) and are counted in $M$. Thus $P_3 = 2 \times \left( \frac{1}{24} F_{10} \right)$, where $\frac{1}{24} F_{10}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 42(d) and 2 is the number of times that this subgraph is counted in $M$. Consequently, $F_{13} = 2 \sum_{j \neq i} a^{(5)}_j a^{(1)}_j (d_j - 1) - \frac{4}{21} F_i - \frac{4}{17} F_2 - \frac{1}{3} F_{10}$.

Figure 42. $v_i - v_j$ walks of length 7 type 13.

**Case 14:** For the configuration of Figure 43(a), $N = 4$, $M = \frac{1}{2} \sum_{j \neq i} a^{(3)}_j a^{(2)}_j$. Let $P_1$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 43(b) and are counted in $M$. Thus $P_1 = 2 \times \left( \frac{1}{42} F_1 \right)$, where $\frac{1}{42} F_1$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 43(b) and 2 is the number of times that this subgraph is counted in $M$. Let $P_2$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 43(c) and are counted in $M$. Thus $P_2 = 1 \times \left( \frac{1}{18} F_3 \right)$, where $\frac{1}{18} F_3$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 43(c) and this subgraph is counted only once in $M$. Let $P_3$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 43(d) and are counted in $M$. Thus $P_3 = 2 \times \left( \frac{1}{32} F_1 \right)$, where $\frac{1}{32} F_1$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 43(d) and 2 is the number of times that this subgraph is counted in $M$. Consequently, $F_{14} = 2 \sum_{j \neq i} a^{(5)}_j a^{(2)}_j - \frac{4}{21} F_i - \frac{2}{9} F_3 - \frac{1}{4} F_2$.

Figure 43. $v_i - v_j$ walks of length 7 type 14.
Case 15: For the configuration of Figure 44(a), $N = 2$, $M = \sum_{j \neq k, j \neq v_i} d_{ij}^{(2)} d_{jk}^{(2)} a_{ij}$. Let $P_1$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 44(b) and are counted in $M$. Thus $P_1 = 2 \times \left( \frac{1}{42} F_1 \right)$, where $\frac{1}{42} F_1$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 44(b) and 2 is the number of times that this subgraph is counted in $M$. Let $P_2$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 44(c) and are counted in $M$. Thus $P_2 = 2 \times \left( \frac{1}{34} F_2 \right)$, where $\frac{1}{34} F_2$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 44(c) and 2 is the number of times that this subgraph is counted in $M$. Let $P_3$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 44(d) and are counted in $M$. Thus $P_3 = 2 \times \left( \frac{1}{24} F_{10} \right)$, where $\frac{1}{24} F_{10}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 44(d) and 2 is the number of times that this subgraph is counted in $M$. Let $P_4$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 44(e) and are counted in $M$. Thus $P_4 = 1 \times \left( \frac{1}{18} F_3 \right)$, where $\frac{1}{18} F_3$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 44(e) and 1 is the number of times that this subgraph is counted in $M$. Consequently, $F_{15} = 2 \sum_{j \neq k, j \neq v_i} d_{ij}^{(2)} d_{jk}^{(2)} a_{ij} - \frac{2}{21} F_1 - \frac{2}{17} F_2 - \frac{1}{6} F_{10} - \frac{1}{9} F_3$.

![Figure 44](image_url)  \( v_i - v_i \) walks of length 7 type 15.

Case 16: For the configuration of Figure 45(a), $N = 2$, $M = \sum_{j \neq k, j \neq v_i} d_{ij}^{(2)} a_{jk} a_{ij} (d_k - 2)$. Let $P_1$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 45(b) and are counted in $M$. Thus $P_1 = 2 \times \left( \frac{1}{24} F_{10} \right)$, where $\frac{1}{24} F_{10}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 45(b) and 2 is the number of times that this subgraph is counted in $M$. Let $P_2$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 45(c) and are counted in $M$. Thus $P_2 = 1 \times \left( \frac{1}{18} F_3 \right)$, where $\frac{1}{18} F_3$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 45(c) and 1 is the number of times that this subgraph is counted in $M$. Consequently, $F_{16} = 2 \sum_{j \neq k, j \neq v_i} d_{ij}^{(2)} a_{jk} a_{ij} (d_k - 2) - \frac{1}{6} F_{10} - \frac{1}{9} F_3$. 
Case 17: For the configuration of Figure 46(a), $N = 4$, $M = \sum_{j=1}^{4} a_{ij}^{(2)} a_{ji} (d_j - 2)(d_i - 2)$. Let $P_i$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 46(b) and are counted in $M$. Thus $P_i = 2 \times \left( \frac{1}{32} F_7 \right)$, where $\frac{1}{32} F_7$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 46(b) and 2 is the number of times that this subgraph is counted in $M$. Consequently, $F_7 = 4 \sum_{j=1}^{4} a_{ij}^{(2)} a_{ji} (d_j - 2)(d_i - 2) - \frac{1}{4} F_7$.

Case 18: For the configuration of Figure 47(a), $N = 2$, $M = \frac{1}{2} \sum_{k,j,k \in i} (d_j - 2)(d_k - 2) a_{ij} a_{ik} a_{jk}$. Let $P_i$ denotes the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 47(b) and are counted in $M$. Thus $P_i = 1 \times \left( \frac{1}{24} F_{10} \right)$, where $\frac{1}{24} F_{10}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 47(b) and 1 is the number of times that this subgraph is counted in $M$. Consequently, $F_{10} = 4 \sum_{k,j,k \in i} (d_j - 2)(d_k - 2) a_{ij} a_{ik} a_{jk} - \frac{1}{12} F_{10}$.
\[ M = \frac{1}{2} \left[ a_n^{(3)} - 5a_n^{(3)} - 2(d_i - 2)a_i^{(3)} - 2 \sum_{j=1,j\neq i} a_j^{(2)} a_j (d_j - 2) - 2 \sum_{j=1,j\neq i} a_j \left( \frac{1}{2} a_j^{(3)} - a_j a_j^{(2)} \right) \right] \] (see Theorem 11) and

\[ F_{19} = 7 \left[ a_n^{(3)} - 5a_n^{(3)} - 2(d_i - 2)a_i^{(3)} - 2 \sum_{j=1,j\neq i} a_j^{(2)} a_j (d_j - 2) - 2 \sum_{j=1,j\neq i} a_j \left( \frac{1}{2} a_j^{(3)} - a_j a_j^{(2)} \right) \right]. \]

**Case 20:** For the configuration of Figure 49(a), \( N = 6 \), \( M = \frac{1}{2} \sum_{k\neq i,j,k\neq i} a_{jk}^{(2)}(d_k - a_{jk} - 1)(a_{jk}a_{jk}a_{jk}) \) (see Theorem 5). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 49(b) and are counted in \( M \). Thus \( P_1 = 2 \times \left( \frac{1}{32} F_7 \right) \), where \( \frac{1}{32} F_7 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 49(b) and 2 is the number of times that this subgraph is counted in \( M \). Consequently, \( F_{20} = 3 \sum_{k\neq i,j,k\neq i} a_{jk}^{(2)}(d_k - a_{jk} - 1)(a_{jk}a_{jk}a_{jk}) - \frac{3}{8} F_7 \).

**Case 21:** For the configuration of Figure 50(a), \( N = 12 \), \( M = \sum_{j=i} a_j^{(2)}(d_j - a_j - 1)(a_j^{(2)}a_j) \) (see Theorem 7). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 50(b) and are counted in \( M \). Thus \( P_1 = 2 \times \left( \frac{1}{32} F_7 \right) \), where \( \frac{1}{32} F_7 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 50(b) and 2 is the number of times that this subgraph is counted in \( M \). Let \( P_2 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 50(c) and are counted in \( M \). Thus \( P_2 = 2 \times \left( \frac{1}{24} F_{10} \right) \), where \( \frac{1}{24} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 50(c) and 2 is the number of times that this subgraph is counted in \( M \).

Consequently, \( F_{21} = 12 \sum_{j=1} a_j^{(2)}(d_j - a_j - 1)(a_j^{(2)}a_j) - \frac{3}{4} F_7 - F_{10} \).
Case 22: For the configuration of Figure 51(a), \( N = 6 \), \( M = \frac{1}{2} \sum_{j \neq i} d_j \left( d_j - a_j - 1 \right) \left( a_j \right) \) (see Theorem 7). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 51(b) and are counted in \( M \). Thus \( P_1 = 2 \times \left( \frac{1}{24} F_{10} \right) \), where \( \frac{1}{24} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 51(c) and are counted in \( M \). Let \( P_2 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 51(d) and are counted in \( M \). Thus \( P_2 = 6 \times \left( \frac{1}{12} F_9 \right) \), where \( \frac{1}{12} F_9 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 51(e) and are counted in \( M \). Let \( P_3 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 51(f) and are counted in \( M \). Thus \( P_3 = 2 \times \left( \frac{1}{32} F_{21} \right) \), where \( \frac{1}{32} F_{21} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 51(g) and are counted in \( M \). Let \( P_4 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 51(h) and are counted in \( M \). Thus \( P_4 = 1 \times \left( \frac{1}{8} F_{29} \right) \), where \( \frac{1}{8} F_{29} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 51(i) and are counted in \( M \). Consequently,

\[
F_{22} = 3 \sum_{j \neq i} d_j \left( d_j - a_j - 1 \right) \left( a_j \right) - \frac{1}{2} F_{10} - 3 F_9 - \frac{1}{2} F_{21} - \frac{3}{8} F_7 - \frac{3}{2} F_{29}. 
\]

Case 23: For the configuration of Figure 52(a), \( N = 2 \),
Let $P_1$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 52(b) and are counted in $M$. Thus $P_1 = 2 \times \left( \frac{1}{14} F_{19} \right)$, where $\frac{1}{14} F_{19}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 52(b) and are counted in $M$.

Let $P_2$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 52(c) and are counted in $M$. Thus $P_2 = 1 \times \left( \frac{1}{12} F_{21} \right)$, where $\frac{1}{12} F_{21}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 52(c) and 1 is the number of times that this subgraph is counted in $M$. Consequently,

$$F_{23} = \sum_{i,j} \alpha_{ij}^{(3)} - 5a_{ij}^{(3)} - 2(d_i - 2) a_{ij}^{(3)} - 2 \sum_{k \neq j} a_{ik}^{(3)} d_{kj} (d_j - 2) - 2 \sum_{k \neq j} a_{kj} \left( \frac{1}{2} a_{ij}^{(3)} - a_{ij}^{(2)} \right) a_{ij} \right] a_{ij} \right) \frac{2}{7} F_{19} - \frac{1}{6} F_{21}. $$

Figure 52. $v_i - v_j$ walks of length 7 type 23.

Case 24: For the configuration of Figure 53(a), $N = 4$,

$$M = \frac{1}{2} \left( a_{ij}^{(3)} - 5a_{ij}^{(3)} - 2(d_i - 2) a_{ij}^{(3)} (d_j - 2) - 2 \sum_{j \neq i} a_{ij}^{(3)} a_j (d_j - 2) (d_i - 2) - 2 \sum_{j \neq i} a_{ij} (d_i - 2) \left( \frac{1}{2} a_{ij}^{(3)} - a_{ij}^{(2)} \right) \right) \right]$$

(See Theorem 11). Let $P_1$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 53(b) and are counted in $M$. Thus $P_1 = 1 \times \left( \frac{1}{12} F_{21} \right)$, where $\frac{1}{12} F_{21}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 53(b) and 1 is the number of times that this figure is counted in $M$. Consequently,

$$F_{24} = 2 \left[ \left( a_{ii}^{(3)} - 5a_{ii}^{(3)} - 2(d_i - 2) a_{ii}^{(3)} (d_i - 2) - 2 \sum_{j \neq i} a_{ij}^{(3)} a_j (d_j - 2) (d_i - 2) \right) \right] - \frac{1}{3} F_{21}. $$
Figure 53. \(v_i - v_j\) walks of length 7 type 24.

Case 25: For the configuration of Figure 54(a), \(N = 2\),
\[
M = \sum_{j \in I} \left( a_{ij}^{(4)} - (d_i + d_j - 3a_{ij}) a_{ij}^{(2)} - \left( a_{ij}^{(3)} + a_{ij}^{(3)} + 2 \left( \frac{d_j - 1}{2} \right) a_{ij} \right) (d_j - 2) a_{ij} \right) \quad \text{(See Theorem 8).}
\]
Let \(P_1\) denote the number of all subgraphs of \(G\) that have the same configuration as the graph of Figure 54(b) and are counted in \(M\). Thus \(P_1 = 2 \times \left( \frac{1}{6} F_{20} \right)\), where \(\frac{1}{6} F_{20}\) is the number of subgraphs of \(G\) that have the same configuration as the graph of Figure 54(b) and 2 is the number of times that this subgraph is counted in \(M\). Let \(P_2\) denote the number all subgraphs of \(G\) that have the same configuration as the graph of Figure 54(c) and are counted in \(M\). Thus \(P_2 = 1 \times \left( \frac{1}{6} F_{22} \right)\), where \(\frac{1}{6} F_{22}\) is the number of subgraphs of \(G\) that have the same configuration as the graph of Figure 54(c) and 1 is the number of times that this subgraph is counted in \(M\). Consequently,
\[
F_{25} = 2 \sum_{j \in I} \left( a_{ij}^{(4)} - (d_i + d_j - 3a_{ij}) a_{ij}^{(2)} - \left( a_{ij}^{(3)} + a_{ij}^{(3)} + 2 \left( \frac{d_j - 1}{2} \right) a_{ij} \right) (d_j - 2) a_{ij} \right) (d_j - 2) a_{ij} - \frac{2}{3} F_{20} - \frac{1}{3} F_{22}.
\]

Figure 54. \(v_i - v_j\) walks of length 7 type 25.

Case 26: For the configuration of Figure 55(a), \(N = 2\),
\[
M = \sum_{j \in I} \left( a_{ij}^{(3)} - (d_i + d_j - 1)a_{ij} \right) a_{ij}^{(2)} - \sum_{k=1}^{n} \left( a_{ik}^{(2)} a_{jk} - a_{ik} a_{ij} \right) a_{jk} - \sum_{k=1}^{n} \left( a_{ij}^{(2)} a_{jk} - a_{ij} a_{jk} \right) a_{jk} \quad (d_j - 2) \quad \text{.}
\]
Let \(P_1\) denote the number of all subgraphs of \(G\) that have the same configuration as the graph of Figure 55(b) and are counted in \(M\). Thus \(P_1 = 1 \times \left( \frac{1}{12} F_{21} \right)\), where \(\frac{1}{12} F_{21}\) is the number of subgraphs of \(G\) that have the same configuration as the graph of Figure 55(b) and 1 is the number of times that this subgraph is counted in \(M\). Let \(P_2\) denote the number of all subgraphs of \(G\) that have the same configuration as the graph of Figure 55(c) and are counted in \(M\). Thus \(P_2 = 1 \times \left( \frac{1}{6} F_{22} \right)\), where \(\frac{1}{6} F_{22}\) is the number of subgraphs of \(G\) that have the same configuration as the graph of Figure 55(c) and 1 is the number of times that this subgraph is counted in \(M\). Consequently,
Case 27: For the configuration of Figure 56(a), \( N = 4 \), \( M = \sum_{j \neq i} \left[ a_{ij}^{(3)} - (d_i + d_j - 1)a_{ij} \right] a_{ij} - \sum_{k \neq i,j} \left( a_{ik}^{(2)} a_{ik} - a_{ik} a_{ik} a_{jk} \right) a_{ik} \)

\[
F_{26} = 2 \sum_{j \neq i} \left[ a_{ij}^{(3)} - (d_i + d_j - 1)a_{ij} \right] a_{ij} - \sum_{k \neq i,j} \left( a_{ik}^{(2)} a_{ik} - a_{ik} a_{ik} a_{jk} \right) a_{ik} \left( d_j - 2 \right) - \frac{1}{6} F_{21} - \frac{1}{3} F_{22}.
\]

Figure 55. \( v_i - v_j \) walks of length 7 type 26.

Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 56(b) and are counted in \( M \). Thus \( P_1 = 1 \times \left( \frac{1}{12} F_{21} \right) \), where \( \frac{1}{12} F_{21} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 56(b) and 1 is the number of times that this subgraph is counted in \( M \). Let \( P_2 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 56(c) and are counted in \( M \). Thus \( P_2 = 2 \times \left( \frac{1}{24} F_{10} \right) \), where \( \frac{1}{24} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 56(c) and 2 is the number of times that this subgraph is counted in \( M \). Let \( P_3 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 56(d) and are counted in \( M \). Thus \( P_3 = 2 \times \left( \frac{1}{12} F_{9} \right) \), where \( \frac{1}{12} F_{9} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 56(d) and 2 is the number of times that this subgraph is counted in \( M \). Let \( P_4 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 56(e) and are counted in \( M \). Thus \( P_4 = 2 \times \left( \frac{1}{32} F_{10} \right) \), where \( \frac{1}{32} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 56(e) and 2 is the number of times that this subgraph is counted in \( M \). Let \( P_5 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 56(f) and are counted in \( M \). Thus \( P_5 = 2 \times \left( \frac{1}{32} F_{9} \right) \), where \( \frac{1}{32} F_{9} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 56(f) and 2 is the number of times that this subgraph is counted in \( M \). Consequently, \( F_{27} = 4 \sum_{j \neq i} \left[ a_{ij}^{(3)} a_{ij} \sum_{k \neq i,j} \left( a_{ik}^{(2)} 2 \right) \right] - \frac{1}{3} F_{21} - \frac{1}{3} F_{10} - \frac{2}{3} F_{9} - \frac{4}{3} F_{20} - \frac{1}{4} F_{7} \).
Case 28: For the configuration of Figure 57(a), \( N = 8 \), \( M = \left( \frac{1}{2} a_{ij}^{(3)} \right) \sum_{j=1}^{a_{ij}^{(2)}} \left( \frac{a_{ij}^{(2)}}{2} \right) \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 57(b) and are counted in \( M \). Thus \( P_1 = 1 \times \left( \frac{1}{12} F_{21} \right) \), where \( \frac{1}{12} F_{21} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 57(b) and 1 is the number of times that this subgraph is counted in \( M \). Let \( P_2 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 57(c) and are counted in \( M \). Thus \( P_2 = 1 \times \left( \frac{1}{24} F_{10} \right) \), where \( \frac{1}{24} F_{10} \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 57(c) and 1 is the number of times that this subgraph is counted in \( M \). Let \( P_3 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 57(d) and are counted in \( M \). Thus \( P_3 = 3 \times \left( \frac{1}{24} F_8 \right) \), where \( \frac{1}{24} F_8 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 57(d) and 3 is the number of times that this subgraph is counted in \( M \). Let \( P_4 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 57(e) and are counted in \( M \). Thus \( P_4 = 2 \times \left( \frac{1}{32} F_7 \right) \), where \( \frac{1}{32} F_7 \) is the number of subgraphs of \( G \) that have the same configuration as the graph of Figure 57(e) and 2 is the number of times that this subgraph is counted in \( M \). Consequently, \( F_{28} = \left( 4a_{ij}^{(3)} \right) \sum_{j=1}^{a_{ij}^{(2)}} \left( \frac{a_{ij}^{(2)}}{2} \right) - \frac{2}{3} F_{21} - \frac{1}{3} F_{10} - \frac{1}{3} F_8 - \frac{1}{2} F_7 \).

Case 29: For the configuration of Figure 58(a), \( N = 4 \), \( M = \frac{1}{2} \sum_{j=1}^{a_{ij}^{(3)}} \left( (d_j-a_{ij}-1) a_{ij}^{(3)} a_{ij}^{(2)} \right) \). Let \( P_1 \) denote the number of all subgraphs of \( G \) that have the same configuration as the graph of Figure 58(b) and are counted
in $M$. Thus $P_1 = 1 \times \left( \frac{1}{12} F_{21} \right)$, where $\frac{1}{12} F_{21}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 58(b) and 1 is the number of times that this subgraph is counted in $M$. Let $P_2$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 58(c) and are counted in $M$. Thus $P_2 = 4 \times \left( \frac{1}{24} F_{10} \right)$, where $\frac{1}{24} F_{10}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 58(c) and 4 is the number of times that this subgraph is counted in $M$. Let $P_3$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 58(d) and are counted in $M$. Thus $P_3 = 4 \times \left( \frac{1}{12} F_9 \right)$, where $\frac{1}{12} F_9$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 58(e) and 4 is the number of times that this subgraph is counted in $M$. Let $P_4$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 58(f) and are counted in $M$. Thus $P_4 = 2 \times \left( \frac{1}{32} F_7 \right)$, where $\frac{1}{32} F_7$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 58(f) and 2 is the number of times that this subgraph is counted in $M$. Consequently,

$$F_{29} = 2 \sum_{j \neq i} \left[ \left( d_j - a_{ij} - 1 \right) a^{(1)}_{ij} a^{(2)}_{ij} \right] - \frac{1}{3} F_{21} - \frac{2}{3} F_{10} - \frac{4}{3} F_9 - \frac{2}{3} F_{22} - \frac{1}{4} F_7.$$  

**Figure 58.** $v_i - v_j$ walks of length 7 type 29.

**Case 30:** For the configuration of Figure 59(a), $N = 4$, $M = \frac{1}{2} \sum_{j \neq i} \left( a^{(1)}_{ij} \right) a^{(2)}_{ij}$. Let $P_1$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 59(b) and are counted in $M$. Thus $P_1 = 1 \times \left( \frac{1}{6} F_{22} \right)$, where $\frac{1}{6} F_{22}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 59(b) and 1 is the number of times that this subgraph is counted in $M$. Let $P_2$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 59(c) and are counted in $M$. Thus $P_2 = 1 \times \left( \frac{1}{24} F_{10} \right)$, where $\frac{1}{24} F_{10}$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 59(c) and 1 is the number of times that this subgraph is counted in $M$. Let $P_3$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 59(d) and are counted
in $M$. Thus $P_3 = 3 \times \left( \frac{1}{24} F_8 \right)$, where $\frac{1}{24} F_8$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 59(d) and 3 is the number of times that this subgraph is counted in $M$. Let $P_4$ denote the number of all subgraphs of $G$ that have the same configuration as the graph of Figure 59(e) and are counted in $M$. Thus $P_4 = 2 \times \left( \frac{1}{32} F_7 \right)$, where $\frac{1}{32} F_7$ is the number of subgraphs of $G$ that have the same configuration as the graph of Figure 59(e) and 2 is the number of times that this subgraph is counted in $M$. Consequently, $P_{30} = 2 \sum_{j=1}^{12} \left( d_j^{(2)} / 2 \right) - \frac{2}{3} F_{22} - \frac{1}{6} F_{10} - \frac{1}{2} F_8 - \frac{1}{4} F_7$.

![Figure 59](image)

Figure 59. $v_i - v_j$ walks of length 7 type 30.

Now, we add the values of $P_j$ arising from the above cases and determine $x$. Substituting the value of $x$ in $\frac{1}{2} \left( d_j^{(2)} - x \right)$ and simplifying, we get the number of 7-cycles each of which contains a specific vertex $v_i$ of $G$. □

Example 3 In the graph of Figure 29 we have, $F_1 = 420$, $F_2 = 1020$, $F_3 = 1080$, $F_4 = 240$, $F_5 = 360$, $F_6 = 240$, $F_7 = 960$, $F_8 = 480$, $F_9 = 360$, $F_{10} = 720$, $F_{11} = 420$, $F_{12} = 120$, $F_{13} = 240$, $F_{14} = 240$, $F_{15} = 240$, $F_{16} = 240$, $F_{17} = 480$, $F_{18} = 120$, $F_{19} = 840$, $F_{20} = 360$, $F_{21} = 1440$, $F_{22} = 720$, $F_{23} = 120$, $F_{24} = 240$, $F_{25} = 240$, $F_{26} = 240$, $F_{27} = 240$, $F_{28} = 240$, $F_{29} = 240$, $F_{30} = 120$. So, we have $x = 13020$. Consequently, By Theorem 14, the number of 7-cycles each of which contains the vertex $v_i$ in the graph of Figure 29 is 0.
