Cytosolic phospholipase A2 S-nitrosylation in ghrelin protection against detrimental effect of ethanol cytotoxicity on gastric mucin synthesis
——Ghrelin in gastric mucosal protection

ABSTRACT

Ghrelin, a peptide hormone produced mainly in the stomach, has emerged recently as an important regulator of nitric oxide synthase (NOS) and cyclooxygenase (COX) enzyme systems, the products of which play direct cytoprotective function in the maintenance of gastric mucosal integrity. In this study, using gastric mucosal cells, we report on the role of ghrelin in countering the cytotoxic effect of ethanol on mucin synthesis. We show that the countering effect of ghrelin on mucin synthesis was associated with the increase in NO and PGE2 production, and characterized by a marked up-regulation in cytosolic phospholipase A2 (cPLA2) activity. The ghrelin-induced up-regulation in mucin synthesis, like that of cPLA2 activity, was subject to suppression by Src inhibitor, PP2 and ERK inhibitor, PD98059, as well as ascorbate. Moreover, the loss in countering effect of ghrelin on the ethanol cytotoxicity and mucin synthesis was attained with cNOS inhibitor, L-NAME as well as COX-1 inhibitor SC-560. The effect of L-NAME was reflected in the inhibition of ghrelin-induced mucosal cell capacity for NO production, cPLA2 S-nitrosylation and PGE2 generation, whereas COX-1 inhibitor caused only the inhibition in PGE2 generation. Our findings suggest that the activation of gastric mucosal cPLA2 through cNOS-induced S-nitrosylation plays an essential role in the countering effect of ghrelin on the disturbances in gastric mucin synthesis caused by ethanol cytotoxicity.

Keywords: Ghrelin; Ethanol Cytotoxicity; Gastric Mucin; CNOS; CPLA2; S-Nitrosylation

1. INTRODUCTION

Acute gastric mucosal lesions, mucosal inflammatory changes, and gastro-duodenal ulceration are well-recognized consequences of alcohol abuse on the health of gastrointestinal tract [1-3]. The gastric mucosal responses to ethanol cytotoxicity are manifested by microcirculatory changes, elevation in proinflammatory cytokine production, enhancement in epithelial cell apoptosis, and the impairment in prostaglandin and nitric oxide signaling pathways [2,4,5]. Furthermore, the disturbances in mucin producing gastric mucosal cells by ethanol affect the synthesis of mucins, the glycoproteins that maintain the integrity and strength of the protective mucus layer which constitutes the pre-epithelial element of gastric mucosal defense [6,7]. Hence, the alterations in the synthesis and processing of gastric mucins induced by ethanol are directly reflected in the impairment of mucus coat function that weakens the inherent resistance of the mucosa to injury, and facilitates the onset of gastric disease [3,6,7].

Recent advances in understanding the nature of factors involved in the maintenance gastric mucosal integrity revealed that the extent of mucosal protection against ethanol cytotoxicity is influenced by ghrelin, a 28-amino acid peptide hormone produced mainly in the stomach [4,8,9]. This endogenous ligand for the growth hormone secretagogue receptor, has been implicated in the control of local inflammations, healing experimentally induced gastric ulcers, and the protection of gastric mucosa against acute injury by ethanol [4,9,10]. Moreover, ghrelin emerged as an important regulator of the cross-talk between NOS and COX enzyme systems [9], the products of which, NO and PGE2, play direct cytoprotective role in maintaining the gastric mucosal integrity under normal physiological conditions [11,12].

Indeed, the literature data support the existence of a functional relationship between the products of NOS and
COX systems, and there are strong indications that the enzyme compartmentalization and substrate availability determines the segregated utilization of the respective products in physiological and pathophysiological processes [13-15]. The stimulation of NO production through NOS induction or the exogenous NO donors leads to up-regulation in COX enzymes activation and the increase in prostaglandin generation [14-17], while the inhibition of NOS decreases prostaglandin formation. Moreover, it has been reported that the NO-induced enzyme protein S-nitrosylation impacts the events of cytosolic phospholipase (cPLA2) activation, and hence influence the processes associated with arachidonic acid release for prostaglandin synthesis [18].

In our previous report, using rat gastric mucosal cells, we have shown that ghrelin protection against ethanol cytotoxicity involves cNOS-mediated cPLA2 activation for the increase in PGE2 production [19]. Here, we examined the influence of ghrelin on the disturbances in gastric mucin synthesis caused by ethanol.

2. MATERIALS AND METHODS

2.1. Cell Preparation and Mucin Synthesis

The gastric mucosal cells, collected from freshly dissected rat stomachs, were suspended in five volumes of ice-cold Dulbecco's modified (Gibco) Eagle's minimal essential medium (DMEM), supplemented with fungizone (50 µg/ml), penicillin (50 U/ml), streptomycin (50 µg/ml), and 10% fetal calf serum, and gently dispersed by trituration with a syringe, and settled by centrifugation [5]. Following rinsing, the cells were resuspended in the medium with a syringe, and settled by centrifugation [5].

After washing with DMEM containing 5% albumin to remove free radiolabel, the cells were resuspended in fresh DMEM and incubated for 2 h in the presence of 3% ethanol [5]. In the experiments evaluating the effect of ghrelin (rat, Sigma), cNOS inhibitor, L-NAME, iNOS inhibitor, 1400 W, Src inhibitor, PD98059 (Calbiochem), ERK1/2 inhibitor, NS398, and ascorbate (Sigma), the cells were first preincubated for 30 min with the indicated dose of the agent or vehicle followed by incubation with ethanol. The viability of cell preparations before and during the experimentation, assessed by Trypan blue dye exclusion assay, was greater than 97%. At the end of the specified incubation period, the cells were centrifuged, washed with phosphate-buffered saline, and the combined supernatants used for mucin assay.

2.2. Mucin Analysis and Ethanol Cytotoxicity Assay

The combined cell wash and incubation medium containing 3H-labeled mucin were treated at 4°C with 10 volumes of 2% phosphotungstic acid in 20% trichloroacetic acid for 4 h and the formed precipitates were collected by centrifugation. The glycoprotein precipitates were dissolved in 6 M urea and chromatographed on a Bio-Gel A-1.5 column, and the mucin fractions eluted in the excluded volume were subjected to analysis for incorporation of radiolabel and protein content [20]. For the measurement of ethanol-induced cytotoxicity, the aliquots of cell suspension from the control and various experimental conditions were centrifuged at 300 × g for 5 min and the supernatants used for the assay of cytotoxicity using TOX-7 lactate dehydrogenase assay kit (Sigma).

2.3. PGE2 and NO Quantification

The aliquots of cell suspension from the control and various experimental conditions were centrifuged at 1500 × g for 5 min and the conditioned medium supernatant collected. PGE2 assays were carried out using a PGE2 EIA kit (Cayman) and 100 µl aliquots of the spent medium supernatant [5]. To assess nitric oxide production in rat gastric mucosal cells, we measured the stable NO metabolite, nitrite, accumulation in the culture medium using Griess reaction [21].

2.4. CPLA2 Activity Assay

The measurement of cPLA2 activity in the gastric mucosal cells following various experimental conditions was carried out using cPLA2 assay kit (Cayman). The cells were homogenized in 1 ml of 50 mM Hepes buffer, pH 7.4, containing 1 mM EDTA, and centrifuged at 10,000 × g for 15 min at 4°C. The supernatants were filtered through an Amicon YM30 filter concentrators, followed by 15 min incubation with 5 µM of calcium-independent PL2A inhibitor, bromoenol lactone, and the aliquots (10 µl) of such prepared cell lysates were subjected to cPLA2 assay [19].

2.5. CPLA2 S-Nitrosylation

A biotin switch procedure was employed to assess the cPLA2 protein S-nitrosylation [22,23]. The gastric mucosal cells, treated with ghrelin (0.8 µg/ml) or L-NAME (300 µM)+ghrelin and incubated for 2 h in the presence of 3% ethanol, were lysed in 0.2 ml of HEN lysis buffer, pH 7.7, and the unnitrosylated thiol groups were blocked with S-methyl methanethiosulfonate reagent [23]. The proteins were precipitated with acetone, resuspended in
0.2 ml of HEN buffer containing 1% SDS, and subjected to targeted nitrothiol group reduction with sodium ascorbate (100 mM). The free thiols were then labeled with biotin and the biotinylated proteins were recovered on streptavidin beads. The formed streptavidin bead-protein complex was washed with neutralization buffer, and the bound proteins were dissociated from streptavidin beads with 50 µl of elution buffer (20 mM HEPES, 100 mM NaCl, 1 mM EDTA, pH 7.7) containing 1% 2-mercaptoethanol [22]. The obtained proteins were then analyzed by Western blotting.

2.6. Western Blot Analysis

The mucosal cells, collected by centrifugation, were resuspended for 30 min in ice-cold lysis buffer [19], and following brief sonication the lysates were centrifuged at 12,000 g for 10 min and the supernatants subjected to protein determination using BCA protein assay kit (Pierce). The samples, including those subjected to biotin switch procedure, were then resuspended in loading buffer, boiled for 5 min, and subjected to SDS-PAGE using 50 µg protein/lane. The separated proteins were transferred onto nitrocellulose membranes and probed with the antibody (Cell Signaling) against the cPLA2, and after incubation with the horseradish peroxidase-conjugated secondary antibody, the protein bands were revealed using an enhanced chemiluminescence detection.

2.7. Data Analysis

All experiments were carried out using duplicate sampling, and the results are expressed as means ± SD. Analysis of variance (ANOVA) was used to determine significance and the significance level was set at $P < 0.05$.

3. RESULTS

To assess the influence of ghrelin on the disturbances in gastric mucin synthesis caused by alcohol cytotoxicity, we employed rat gastric mucosal cells exposed to ethanol at the dose range (3%) that impairs the mucosal capacity for mucin synthesis and prostaglandin generation [1-3]. We determined that preincubation of the mucosal cells with ghrelin led to a concentration-dependent prevention of ethanol cytotoxicity, and afforded nearly complete protection at 0.8 µg/ml of ghrelin (Figure 1). Further, our results revealed that cytotoxicity induced in gastric mucosal cells by 3% ethanol was reflected in a 32.6% decrease in mucin synthesis (Figure 1), as well as a 29.8% reduction in PGE2 generation and a 51.7% drop in NO production (Figure 2). Ghrelin at its optimal concentration (0.8 µg/ml) for the protection against ethanol cytotoxicity evoked a 55.4% increase in the mucosal cell capacity for mucin synthesis (Figure 1), while NO production increased 2.1-folds and PGE2 generation by 53.1% (Figure 2).

Moreover, we found that significant loss in the preventive effect of ghrelin on the ethanol-induced toxicity and the cell capacity for mucin synthesis was attained with cNOS inhibitor, L-NAME as well as specific COX-1 inhibitor, SC-560, while selective iNOS inhibitor, 1400W and a specific COX-2 inhibitor, NS-398 had no effect (Figure 3). The effect of L-NAME, furthermore, was reflected in the inhibition of ghrelin-induced mucosal cell capacity for NO production as well as PGE2 generation, whereas the pretreatment with COX-1 inhibitor,

Values represent the means ± SD of five experiments. *\(P < 0.05\) compared with that of control. **\(P < 0.05\) compared with that of Et alone. ***\(P < 0.05\) compared with that of Gh + Et.

As the initial and rate limiting step in prostaglandin production is the liberation of arachidonic acid from membrane phospholipids by highly selective cPLA2 [5,24], we next analyzed the effect of ghrelin on the mucosal cell cPLA2 enzymatic activity. We found that ghrelin countering effect on the ethanol-induced cytotoxicity and the mucosal cell capacity for mucin synthesis was reflected in a 56.5% increase in cPLA2 activity (Figure 5). Furthermore, the ghrelin-induced up-regulation in cPLA2 activity, like that of mucin synthesis, was subject to suppression by Src kinase inhibitor, PP2, while the inhibitor of MAPK/ERK1/2, PD98059, caused the suppression in mucin synthesis and PGE2 generation, but had no effect on NO production (Figures 3 and 4).

Since in addition to phosphorylation, the activation of cPLA2 involves the NO-dependent enzyme protein S-nitrosylation [18,19], we further analyzed the influence of S-nitrosylation on gastric mucosal cPLA2 activity. The results revealed that ghrelin-induced up-regulation in cPLA2 activity and the cell capacity for mucin synthesis was susceptible to suppression not only by the inhibi-
bitor of cNOS, L-NAME, but also by ascorbate (Figure 5), which is in keeping with known susceptibility of S-nitrosylated proteins to this reducing agent [14,23]. Moreover, Western blot analysis of the mucosal cell lysates subjected to biotin switch procedure, with antibody against cPLA₂, revealed that ghrelin prevention of the ethanol-induced cytotoxicity was manifested in the increase in cPLA₂ protein S-nitrosylation, whereas preincubation with L-NAME blocked the ghrelin-induced cPLA₂ nitrosylation (Figure 6).

4. DISCUSSION

Acute gastric mucosal injury and gastro-duodenal ulcerations are the most common consequences of alcohol abuse on the health of gastrointestinal tract [1-3]. Moreover, the disturbances in gastric mucosal cells caused by ethanol cytotoxicity affect the synthesis of mucins, the glycoproteins that maintain the integrity and strength of the protective mucus layer, and hence weaken the inherent resistance of the mucosa to injury and facilitate the onset of gastric disease [6,7]. Therefore, considering the recent evidence for the involvement of ghrelin in gastric mucosal protection against injury by ethanol [4,9], in the study presented herein we examined the influence of this 28-amino acid peptide hormone on the synthesis of gastric mucin.

Using rat gastric mucosal cells exposed to ethanol at the concentration range that impairs mucosal cell capacity for mucin synthesis and prostaglandin generation [1-3], we demonstrated that the protective effect of ghrelin against ethanol cytotoxicity was associated with up-regulation in mucin synthesis, and accompanied by the increase in NO and PGE2 production, and the enhancement in cPLA₂ activity. A significant loss in the countering effect of ghrelin on the ethanol-induced cytotoxicity and the cell capacity for mucin synthesis was attained with cNOS inhibitor, L-NAME as well as specific COX-1 inhibitor, SC-560, whereas COX-2 inhibitor, NS-398, and iNOS inhibitor, 1400W, had no effect. These findings are thus in keeping with the results of earlier studies suggesting that the detrimental effect of ethanol on gastric mucin synthesis are associated with the impairment in NO and PGE2 generation [1-3,6,25], and lend further credence as to the role of ghrelin in regulation of the cross-talk between NOS and COX enzyme systems [9].

Further, we found that the countering effect of ghrelin on the ethanol-induced changes in mucin synthesis, and NO and PGE2 production, were subject to suppression by Src kinase inhibitor, PP2, whereas the inhibitor of MAPK/ERK, PD98059, elicited suppression in mucin synthesis and PGE2 generation, but had no effect on NO production. Thus the activation of Src appears to be a triggering event whereby ghrelin is capable of affecting the mucosal cell capacity for mucin synthesis as well as NO and PGE2 generation. Moreover, our data on the inhibition of ghrelin-induced mucosal cell capacity for mucin synthesis, and NO and PGE2 generation by L-NAME, and only that of PGE2 and mucin synthesis by COX-1 inhibitor, SC-560, suggest that ghrelin-induced up-regulation in mucin synthesis and PGE2 generation occurs with the involvement of cNOS-derived NO, and requires COX-1 participation. Indeed, the role of NO in modulation of COX enzymes activity in a variety of different systems is well documented [15-17].

As the initial and rate limiting event in prostaglandin production is the release of AA from membrane phospholipids by highly selective cPLA₂ [5,24], we further assessed the influence of ghrelin on the processes of cPLA₂ activation. We found that ghrelin elicited up-regulation in the mucosal cell cPLA₂ activation, which like that of mucin synthesis was subject to suppression by Src inhibitor, PP2, and ERK1/2 inhibitor, PD98059, as well as the inhibitor of cNOS, L-NAME. However, COX-1 inhibitor, SC-560, while not causing discernible alteration in the cPLA₂ activity, exerted the inhibitory effect on mucin synthesis. Hence, we concluded that the activation of gastric mucosal cPLA₂ by ghrelin for the increase in mucin synthesis to counter ethanol cytotoxicity occurs with the involvement of cNOS and requires Src kinase-dependent MAPK/ERK participation. Indeed, the literature data indicate that MAPK/ERK-dependent cPLA₂ phosphorylation on the critical Ser²⁶⁵ residue plays a crucial role in Ca²⁺-dependent translocation of cPLA₂ from cytosol to membrane to gain access to AA-rich phospholipid substrates [5,26].

Whilst regulation of the key enzymes for prostaglandin

---

**Figure 6.** Effect of cNOS inhibitor, L-NAME (LN) on ghrelin (Gh)-induced cPLA₂ S-nitrosylation in gastric mucosal cells exposed to ethanol (Et). The cells were treated with Gh or L-NAME + Gh and incubated for 2 h in the presence of Et. A portion of the cell lysate was processed by biotin switch procedure for protein S-nitrosylation and, along with the remainder of the lysates, subjected to SDS-PAGE, transferred to nitrocellulose and probed with anti-cPLA₂ antibody. The immunoblots shown are representative of three experiments.
production through phosphorylation is well recognized, recent evidence indicates that the increase in prostaglan-
din formation may also result from NO-induced enzyme
protein S-nitrosylation [14,17-19]. Indeed, the post-trans-
lation modification through S-nitrosylation at the critical Cys152
residue has been linked to the NO-induced enhancement in catalytic activity of COX-2 [14], and cPLA2 activation through S-nitrosylation at Cys152 was reported to be responsible for up-regulation in arachi-
donic acid release in human epithelial cells [18]. Therefore,
to assess the role of ghrelin in cPLA2 activation, we fur-
ther analyzed the influence of S-nitrosylation on gas-
tric mucosal cPLA2 activity and the capacity for mucin
synthesis. We found that ghrelin-induced up-regulation in cPLA2 activity and the cell capacity for mucin synthe-
sis was susceptible to suppression not only by the in-
hibitor of cNOS, L-NAME, but also by ascorbic acid,
which is keeping with well known susceptibility of S-
nitrosylated proteins to this reducing agent [14,23].
Moreover, Western blot analysis of the mucosal cell lys-
ates subjected to biotin switch procedure with antibody
against cPLA2 revealed that ghrelin prevention of the
ethanol-induced cytotoxicity was manifested in the in-
creased cPLA2 protein S-nitrosylation, whereas prein-
cubation with cNOS inhibitor, L-NAME resulted in the
blockage of the ghrelin-induced cPLA2 protein S-nitro-
sylation. Therefore, consistent with our results, the cPLA2
activation by ghrelin through S-nitrosylation is of direct
relevance to the mucosal capacity for mucin synthesis and
PGE2 generation, and hence the protection of gastric
mucosal cells against ethanol cytotoxicity.

In summary, our study demonstrates that the activa-
tion of gastric mucosal cPLA2 through S-nitrosylation
plays an essential role in the counteracting effect of ghrelin
on the ethanol-induced disturbances in gastric mucin
synthesis.
