ABSTRACT

In this paper, we consider the Black-Scholes (BS) equation for option pricing with constant volatility. Here, we construct the first-order Darboux transformation and the real valued condition of transformed potential for BS corresponding equation. In that case we also obtain the transformed of potential and wave function. Finally, we discuss the factorization method and investigate the supersymmetry aspect of such corresponding equation. Also we show that the first order equation is satisfied by commutative algebra.

Keywords: Black-Scholes Hamiltonian; Darboux Transformation; Supersymmetry

1. Introduction

As we know, there are several methods to study for the integrability model. One of the method, we focus here, is Darboux transformation. It is well known that the Darboux transformation [1] is one of the major tools for the analysis of physical systems and for finding new solvable systems. Using a linear differential operator, Darboux construct solutions of one ordinary differential equation in terms of another ordinary differential equation. It has been shown that the transformation method is useful in finding soliton solutions of the integrable systems [2-4] and constructing supersymmetric quantum mechanical systems [5-7]. Also, more general solvable cases were obtained by means of factorization methods [8] and via algebraic approaches [9-13]. Darboux transformation is known as one of the most powerful methods for finding solvable Schrodinger equations with constant mass, in the context of which it is also called supersymmetric factorization method [14]. On the other hand, during the past few years there has been great interest in studying problems of finance using various tools of physics [15]. In that case also quantum mechanics has been used to analyze option pricing, stock market returns [16,17] and the Black-Scholes (BS) equation [18-21]. The BS equation plays an important role in option pricing. The solution of such equation may be found by mapping it into a Schrodinger-like equation. So, we take advantage from Darboux transformation to this equation and obtain the generalized form of BS equation.

The Darboux transformation has been extensively used in quantum mechanics in the search of isospectral potential for exactly Schrodinger equations of constant mass and position-dependent mass [22-27]. So, we take advantage from such transformation and obtain the effective potential, modified wave function and shape invariance condition and generators of supersymmetry algebra. For the BS Hamiltonian help us to transform of the corresponding potential.

This paper is organized as follows. We first introduce Quantum BS Hamiltonian and apply the Darboux transformation to such equation. In that case we show that the corresponding Hamiltonian changes to new form of potential. Finally, we study the supersymmetry version and shape invariance condition for transformed BS Hamiltonian.

2. Darboux Transformation and BS Hamiltonian

As we know the BS equation for option pricing with constant volatility is given by,

\[ \frac{\partial C}{\partial t} + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 C}{\partial S^2} + rS \frac{\partial C}{\partial S} - rC = 0 \]  

(1)

where \( C \), \( S \), \( \sigma \) and \( r \) denote the price of the option,
the stock price, the volatility of the stock price and the risk-free spot interest rate respectively. Now we consider
the following generalized BS equation in \((1 + 1)\)-dimension by using the Darboux transformation operator technique [26,27],

\[
\frac{1}{S} C_t + \frac{1}{2} \sigma^2 S C_{ss} + r C_s - \frac{r}{S} C = 0
\]  

(2)

Now, we take \(H = \frac{1}{2} S\), \(F = \frac{1}{2} \sigma^2 S\), \(G = r\) and the potential \(V = -\frac{r}{S}\). Here we can rewrite the above equation as,

\[
C_t + \frac{F}{H} C_{ss} + \frac{G}{H} C_s + \frac{V}{H} C = 0
\]  

(3)

and

\[
C_t + \eta C = 0, \quad \eta = \frac{F}{H} C_{ss} + \frac{G}{H} C_s + \frac{V}{H}
\]  

(4)

In order to have same Equation as (2) with different of potential,

\[
\hat{C}_t + \hat{\eta} C = 0, \quad \hat{\eta} = \frac{\hat{F}}{\hat{H}} C_{ss} + \frac{\hat{G}}{\hat{H}} C_s + \frac{\hat{V}}{\hat{H}}
\]  

(5)

Here, we have \(V \neq \hat{V}\), this lead us to imply \(C \neq \hat{C}\). In order to obtain the modified potential \(\hat{V}\) and corresponding wave function for Equation (5), we introduce operator \(\Delta\) which are called Darboux transformation. The general form of such translation Darboux transformation will be as

\[
\Delta = A + B \partial_i
\]  

(6)

and we take special case as \(A = B\). Also we note here there are some following properties for this Darboux transformation,

\[
\Delta(\partial_i + \eta) = (\partial_i + \hat{\eta}) \Delta
\]  

(7)

and

\[
\hat{C}(S,t) = \Delta C(S,t)
\]  

(8)

In order to obtain the parameter \(A\) we need to use the Equations (2) and (7), so we have,

\[
\Delta \left( \partial_i + \frac{\hat{F}}{\hat{H}} \partial_{ss} + \frac{\hat{G}}{\hat{H}} \partial_s + \frac{\hat{V}}{\hat{H}} \right) C = 0
\]  

(9)

Making linear independence of \(C\) and its partial derivatives, we collect their respective coefficients and equal them to zero, from which we can obtain the following system about the functions \(A\) and \(\hat{V}\),

\[
A = \alpha \sqrt{\frac{F}{H}} = \alpha \sqrt{\frac{1}{Sr}}
\]  

(10)

as we know the usual \(C(S,t) = e^t C(S)\), so the \(\hat{V}\) will be as,

\[
\hat{V} = V + \frac{c}{S} + \sigma
\]  

(11)

which is modified potential and obtained by the Darboux transformation. By using the Equation (8) one can calculated the corresponding wave function \(C(S,t)\) as,

\[
\hat{C}(S,t) = \alpha \sqrt{\frac{1}{Sr}} (1 + \partial_s) C(S)
\]  

(12)

3. Supersymmetry and Darboux Transformation

In what follows we will prove that the formalism of supersymmetry for our generalized BS equation is equivalent to the Darboux transformation. Here we suppose the BS operator \(\partial_i - \theta\) is self adjoint,

\[
(\partial_i - \theta)^* \theta = \partial_i - \theta
\]  

(13)

Taking the operation of conjugation on Darboux transformation (7), we obtain

\[
(\partial_i + \theta)^* \Delta^* (\partial_i + \hat{\eta}) = \Delta^* (\partial_i + \hat{\eta})
\]  

(14)

where the operator \(\Delta^*\) adjoint to \(\Delta = \alpha \sqrt{\frac{1}{Sr}} (1 + \partial_s)\) is given by,

\[
\Delta^* = \alpha \sqrt{\frac{1}{Sr}} (1 - \partial_s)
\]  

(15)

Equations (4) and (5) can then be rewritten as one single matrix equation of the form,

\[
\begin{bmatrix}
0 & 0 \\
\partial_i & \hat{\eta}
\end{bmatrix}
\begin{bmatrix}
C \\
\hat{C}
\end{bmatrix} = 0
\]  

(16)

Assuming that \(H = \text{diag}(\eta, \hat{\eta})\) and \(C = (c, \hat{c})^T\), the above equation can be written as,

\[
[\partial_i + H] C = 0
\]  

(17)

Two supercharge operators \(Q\) and \(Q^*\) are defined as follows,

\[
Q = \begin{bmatrix}
0 & 0 \\
\Delta & 0
\end{bmatrix}, \quad Q^* = \begin{bmatrix}
0 & \Delta^* \\
0 & 0
\end{bmatrix}
\]  

(18)

where \(\Delta\) and \(\Delta^*\) are the operator given by Equations (6) and (15), respectively. One can show that the Hamiltonian \(H\) satisfies the following expressions,

\[
\{Q, Q\} = \{Q^*, Q^*\} = 0
\]

\[
[Q, \partial_i + H] = [\partial_i + H, Q]
\]

\[
[Q^*, \partial_i + H] = [\partial_i + H, Q^*]
\]  

(19)

Considering the complementing relations of the su-
persymmetry algebra; the anti commutators \( \{Q, Q^*\} \) and \( \{Q^*, Q\} \), we obtain the operators \( R = Q Q^* \) and \( \hat{R} = Q Q^* \), and consider the relations of them with our Hamiltonian \( \eta \) and \( \eta^* \). So, one obtain the \( R \) and \( \hat{R} \) as follow,

\[
R = |\alpha|^2 \left[ \frac{F}{H} (1 - \partial_s) - \left( \frac{\partial}{H} \right) \left( \partial_s + 1 \right) \right]
\]

(20)

and

\[
\hat{R} = |\alpha|^2 \left[ \frac{F}{H} (1 - \partial_s) - \left( \frac{\partial}{H} \right) \left( \partial_s + 1 \right) - \frac{1}{2} \left( \frac{F}{H} \right) \left( \partial_s \right) + \frac{F_s}{2FH} \right]
\]

(21)

where the indices \( s \) will be derivative with respect to \( S \). In order to have shape invariance and supersymmetric algebra we need to obtain the \( \hat{R} - R \). If such value be constant and zero there is some supersymmetry partner for the such system. Otherwise we need to apply some condition in \( \hat{R} - R \) to have constant value. So, one can obtain the following equation for the \( \hat{R} - R \),

\[
\hat{R} - R = |\alpha|^2 \left( i\sigma^2 \right)
\]

(22)

We mention here that if we want to supersymmetry algebra we need to have also the following commutation relation, and also anti-commutation relation between \( Q \) and \( Q^* \),

\[
\{Q, Q\} = \{Q^*, Q^*\} = 0, \quad \{Q, Q^*\} = H
\]

(23)

Finally we can say that the Equations (18), (19) and (23) lead us to apply the condition on the Equation (22) such that the expression \( \hat{R} - R \) be constant. So, in that case, \( \sigma \) must be function of \( S \) such as \( \sigma \sim S^{1/2} \).

4. Conclusion

In this paper we studied the Black-Scholes (BS) equation. We used the first-order Darboux transformation and applied it to the BS equation. In order to relate between supersymmetry and Darboux transformation we discussed the supersymmetry algebra and its commutation and anti-commutation super algebra. We have shown that for the satisfying such anticommutation supercharges the \( \hat{R} - R \) must be constant. Also, we applied the condition on the \( \hat{R} - R \) and shown that \( \sigma \) will be function of \( S \) as \( \sigma \sim S^{1/2} \). This condition completely guarantees relation between supersymmetry and Darboux transformation.
